

Canadian Data Report Of Hydrography and Ocean Sciences

Data reports provide a medium for the documentation and dissemination of data in a form directly useable by the scientific and engineering communities. Generally, the reports contain raw and/or analyzed data but will not contain interpretations of the data. Such compilations commonly will have been prepared in support of work related to the programs and interests of the Ocean Science and Surveys (OSS) sector of the Department of Fisheries and Oceans.

Data reports are not intended for general distribution and the contents must not be referred to in other publications without prior written authorization from the issuing establishment. The correct citation appears above the abstract of each report. Data reports are abstracted in *Aquatic Sciences and Fisheries Abstracts* and indexed in the Department's annual index to scientific and technical publications.

Data reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out of stock reports will be supplied for a fee by commercial agents.

Regional and headquarters establishments of Ocean Science and Surveys ceased publication of their various report series as of December 1981. A complete listing of these publications is published in the *Canadian Journal of Fisheries and Aquatic Sciences*, Volume 39: Index to Publications 1982. The current series, which begins with report number 1, was initiated in January 1982.

Rapport statistique canadien sur l'hydrographie et les sciences océaniques

Les rapports statistiques servent de véhicule pour la compilation et la diffusion des données sous une forme directement utilisable par les scientifiques et les techniciens. En général, les rapports contiennent des données brutes ou analysées, mais ne fournissent pas d'interprétation des données. Ces compilations sont préparées le plus souvent à l'appui de travaux liés aux programmes et intérêts du service des Sciences et levés océaniques (SLO) du ministère des Pêches et des Océans.

Les rapports statistiques ne sont pas destinés à une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans une autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports statistiques sont résumés dans la revue *Résumés des sciences halieutiques et aquatiques*, et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les rapports statistiques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés sont fournis contre rétribution par des agents commerciaux.

Les établissements des Sciences et levés océaniques dans les régions et à l'administration centrale ont cessé de publier leurs diverses séries de rapports en décembre 1981. Une liste complète de ces publications figure dans le volume 39, Index des publications 1982, du *Journal canadien des sciences halieutiques et aquatiques*. La série actuelle a commencé avec la publication du rapport numéro 1 en janvier 1982.

PREFACE

This group of data catalogues is produced by the Ocean Information Division at the Institute of Ocean Sciences. Joint government/industry contract projects have catalogued marine data sets focusing primarily upon oceanography and fisheries. Data set quality appraisals are provided to assist in establishing the usefulness of certain data for particular kinds of analyses and the confidence to be placed in interpretations. This will assist in setting priorities for incorporating the most useful data in the national Marine Environmental Data Service (MEDS) archives. Additional uses range from contributing to research planning, especially for climatological studies, to providing the best available resume of marine data sources for environmental assessments.

Accompanying the accelerating pace of Arctic offshore development activity is the need to review the sufficiency and suitability of available scientific information for design, regulatory and planning purposes. This review process has been divided into three phases: the first phase involves compilation and appraisal of all existing data sets; the second concentrates upon analysis of the suitability of the historical data for contributing to questions of particular interest; while the third relates primarily to analysis and/or interpretation of data and estimation of the scientific confidence in answering particular questions. This report represents the results of the first phase for the physical oceanographic data of the Canada Basin and surrounding waters.

Can. Data Rep. Hydrogr. Ocean Sci. 5: (Vol. 7) 642 p.

This volume is one of a group of catalogues designed to compile and appraise marine data sets for the Canadian Arctic. For user convenience, the group has been organized with its subject matter divided into three general disciplines: physics, chemistry and biology. The Arctic has been arbitrarily divided into seven geographical areas incorporating, where possible, major oceanographic regions. The format throughout has been structured to facilitate comparison among subjects and regions. With such a large undertaking it is not possible to provide all reports at once. Therefore catalogues which are presently available in the series are indicated on the inside back cover of each volume.

Data collection is a continuing process and further updates of the catalogues are planned. Readers are requested to submit corrections and additions by writing the issuing establishment. Such corrections will be incorporated in on-line computerized data set listings and will be continuously available upon request.

SOMMAIRE

J.R. Birch, D.B. Fissel, A.B. Cornford and H. Melling. Arctic Data Compilation and Appraisal. Volume 7. Canada Basin-Arctic Ocean: Physical Oceanography - Temperature, Salinity, Currents and Water Levels.
Can. Data Rep. Hydrogr. Ocean Sci. 5: (Vol. 7) 642 p.

Le présent volume fait partie d'un groupe de catalogues destinés à compiler et à évaluer les séries de données marines sur l'Arctique canadien. Pour plus de commodité, la question traitée est structurée en trois grandes disciplines: physique, chimie et biologie. L'Arctique a été divisé arbitrairement en sept régions géographiques qui englobent autant que possible les grandes régions océanographiques. Les catalogues sont présentés de façon à faciliter la comparaison entre les sujets et les régions. Le domaine est si vaste qu'il est impossible de fournir tous les catalogues en une seule fois. Les catalogues de la série actuellement disponibles sont indiqués à la fin de chaque volume à l'intérieur de la couverture.

La collecte des données est un processus permanent et il est prévu de mettre à jour les catalogues par la suite. Les lecteurs sont invités à soumettre par écrit les corrections et les additions à l'établissement auteur. Ces corrections seront traitées en direct sur ordinateur et incorporées aux listings qui pourront être obtenus sur demande.

ACKNOWLEDGEMENTS

The authors would like to thank all those who aided in the preparation of this report. Most of the scientists we approached were very cooperative in supplying information. We wish to thank George Floyd of the Institute of Ocean Sciences, for the supervision of ID number assignment and map production; and Dr. L.G. Giovando and Mr. B. Smiley for reviewing the manuscript. Much appreciated assistance was received from Bill Griffiths of LGL; Dick Tripp, University of Washington; Bob Britch of NORTEC; Jack Colonell of Woodward - Clyde Consultants Ltd.; Lon Hachmeister, Scientific Application Inc.; Don Schell, University of Alaska; Jean Gagnon and Miriam Morrison, MEDS; Heywood Schyer, NODC; Sid Stillwaugh, NODC/NESDIS; Doug Martin, National Ocean Survey; and Mauri Pelto, OCSEAP. Special thanks are also due to the following Arctic Sciences Ltd. personnel: Sue Luscombe for data entry; Sheila Norton, Jeneen Oberski, Brian Clarke and Nancy Andrew for preparing the manuscript; and Rene Chave for computer program development.

SPECIAL CREDITS

L.S.C. Thomson - Technical editing.

Funding for this work was provided by the Office of Energy, Research and Development (OERD).

ARCTIC DATA COMPILATION AND APPRAISAL

VOLUME 7

CANADA BASIN-ARCTIC BASIN: PHYSICAL OCEANOGRAPHY

The area covered by this volume is shaded in the map above.

**VOLUME 7: Canada Basin-Arctic Ocean: Physical Oceanography
Temperature, Salinity, Currents and Water Levels**

VOLUME ABSTRACT

This inventory contains a catalogue of physical oceanographic data collected in the Canada Basin and surrounding waters. Times and locations of measurements are listed and displayed graphically for temperature-salinity, current-meter, water-level and drifter data. Meteorological and ice information are not included. Yearly plots showing the locations of all measurements are included, as are indexes by area and measurement types. References and sources are listed for all data included in the inventory.

Key words: Canada Basin, Alaskan Beaufort Sea, currents, inventory, salinity, temperature, tides, water properties.

1. INTRODUCTION

In this report, the physical oceanographic data collected in the Canada Basin and surrounding waters, including the Alaskan Beaufort Sea, are catalogued. The information provided includes the time and locations of measurements, the parameters measured, and the type of instrumentation. The data themselves are not included but a source for the data and any reports or references are cited wherever possible. This will enable potential users of the data to determine what is available in their area of interest, or what data were collected using a specific measurement technique, and whether or not those data may be of value.

Approximately 340 data sets collected from 1883 through 1983 are catalogued and inventoried. Very few data were collected before 1948 (see Section 3, Figure 2), and these measurements are crude by today's standards.

The data inventory is ongoing. As new data and previously inaccessible data become available, they will be added to a computerized data base maintained at the Institute of Ocean Sciences, Sidney, B.C. Information concerning new data sets, older data sets which are not in the catalogue, or errors, should be submitted to the Ocean Information Section of the Institute of Ocean Sciences.

2. STUDY AREA

The study area is indicated by the non-shaded portions of Figure 1. The surface area is immense, about 2,000,000 km², or roughly the size of British Columbia, Alberta and Saskatchewan combined. Included are the portions of the Arctic Ocean between 28 and 180°W longitude, as well as the bordering continental slopes and shelves of northern Greenland, the Canadian archipelago and Alaska.

For the sake of completeness, all of the extensive AIDJEX (Arctic Ice Dynamics Joint Experiment 1975-1976) data have been inventoried, including those data acquired beyond the area of this study in the Canadian Beaufort Sea. Complete listings are provided in Section 11.4 and 11.5.

**CANADIAN DATA REPORT OF
HYDROGRAPHY AND OCEAN SCIENCES
NO. 5**

Figure 1a: The Canada Basin data compilation area (non-shaded). Depth contour values are in metres.

Figure 1b: Placenames for the Alaskan coastal area.

The major bathymetric feature is the Canada Basin, which comprises almost half the study area and has depths exceeding 3000 m. North of the Canada Basin are three submarine ridges, the Alpha, Mendeleev and Lomonosov ridges. The latter rises to depths as shallow as 1300 m. The Makarov Basin lies between the Lomonosov and Mendeleev ridges, and is separated from the Canada Basin by a sill of between 2000 and 2500 m depth. West of the Canada Basin lies the Chukchi Shelf and the Northwind Ridge/Chukchi Plateau extension. The study area also includes the Alaskan Beaufort Sea slope and shelf, as well as the coastal waters off the Queen Elizabeth Islands and northern Greenland.

Although the study area is immense, the amount of oceanographic data collected to the present has been limited by the harsh climate and the sea-ice which covers much of the area. Open water is confined largely to the coastal regions and to summer. The breadth of open water at the coast can vary from negligible to a few hundred kilometres offshore, depending on wind and melt conditions. Because of the ice coverage, data over most of the area have been obtained by landing aircraft on the ice, and from drifting ice stations. Only in the Alaskan coastal regions have surface vessels been effective in the collection of oceanographic data.

3. HISTORICAL DATA

Physical oceanographic data collection began in the late 1800's, with water-level data collected by early explorers. Starting in the late 1930's, expeditions were conducted in which the collection of oceanographic data was one of the main objectives (Figure 2). 1937 was the first year of Soviet drifting ice station activity. Such ice stations became permanent features in the Arctic Ocean following 1954. In the Alaskan Beaufort Sea coastal waters U.S. icebreakers were used to collect data, starting in the 1950's. The Americans and Canadians also used the ice island T-3 (often known as Fletcher's) as a base for offshore operation from 1952 through 1974 (Figure 8).

After the discovery of the Prudhoe Bay oil field in 1968, the rate of data collection increased significantly (Figure 2), largely due to requirements for engineering design and environmental impact assessment. The National Oceanic and Atmospheric Administration (NOAA) initiated the (Alaskan) Outer Continental Shelf Environmental Assessment Program (OCSEAP) in response to the need for environmental information in the lease areas on the Alaskan outer continental shelf. About the same time, University of Alaska involvement in marine studies in these areas increased. Many of these programs were NOAA/OCSEAP funded, along with the physical oceanographic programs of Prof. K. Aagaard and collaborators of the University of Washington. The main Arctic Ice Dynamics Joint Experiment (AIDJEX) of 1975-1976 increased the scientific data base immensely.

4. GENERAL REPORT LAYOUT AND USER INSTRUCTIONS

4.1 DATA SETS

The data are organized in sets, where each set consists of data of a common type taken on a single expedition or cruise, usually by a single institution or organization. Thus, unless otherwise noted, all the data within a single set are assumed to have been collected in a uniform manner and should conform to a common standard of measurement.

Figure 2: The level of oceanographic effort by year, as indicated by the number of bottle/CTD stations. Note that a large number of stations, occupied by Soviet investigators from the mid-1950's to the present, could not be included in the figure due to lack of detailed information.

Each data set has been assigned an identification number of the form yy-nnnn, where yy = last 2 digits of the year in which data were collected and nnnn = order of identification for that particular data set for that year (The one data set obtained prior to 1900 (1883) has been assigned the identifier 1883-1). The data set number is a unique identifier which applies throughout the entire series of inventories; any set identified, for example, as 72-0009 is the same data set no matter where the reference to it is made. Gaps may appear in the sequence of data set numbers in this inventory for a particular year, because each data set will not appear in every discipline and geographical area.

4.2 INVENTORY ORGANIZATION

Table 1 (Section 8) lists all the data sets in the inventory ordered by data set number. It provides a summary description of each set including the times, areas and methods of measurements. Table 1 also gives a listing of concurrent measurements from other disciplines.

Geographical and measurement type indexes are in Section 10. The sub-areas in the geographic index are shown on the maps in Figure 1. Section 10 also contains an index of references, ordered by data-set number. It is primarily an index of original data reports, although ancillary papers analyzing or discussing the data are listed if they came to our attention.

Measurement locations are plotted in a series of maps in Section 9. Eight different maps, all in Polar Stereographic projection, have been used to plot data. In most cases, the overall map of the entire study area is used, along with one or more of the enlarged maps. The coastlines have been smoothed, and small islands removed, to avoid clutter. Map specifications and a key to the symbols on the maps is presented at the beginning of Section 9.

Detailed listings of the times and locations of individual measurements are in Section 11. There is a separate listing for each data type. The beginning of Section 11 explains the format of the listings.

Data sets were rated according to the criteria in Section 5. The ratings are listed in Table 1. Appendix 1 contains comments explaining the reasons for low ratings, a list of any errors found in each data set, and any other pertinent remarks concerning the data. The comments are ordered by data-set number.

Section 6 contains a general description of the extent of the data available in this area. Sections 6.1 and 6.2 describe their geographical and seasonal distribution. Section 6.3 tabulates instances of repeated measurements in the same area, and instances where measurements were carried out simultaneously, in different areas, or by different agencies.

4.3 SAMPLE USE OF THE INVENTORY

A typical use of the inventory might go as follows:

1. Examine the maps in Section 9 for measurements during the year(s) of interest, and note the data-set numbers of interest.

2. Refer to Table 1 to find the range of measurement dates, measurement methods, accuracies and data sources.
3. If more specific information is required concerning the timing or location of individual measurements in the set, refer to Section 11.
4. Consult the reference index in Section 10 for works referring to or using the data.

5. DATA RATING, APPRAISAL

5.1 TYPES OF DATA

5.1.1 BOTTLE CAST DATA

These data consist of temperature and salinity measurements at discrete depths (ideally the international standard depths) by means of reversing thermometers and sampling bottles. Temperature accuracies of $\pm 0.01^{\circ}\text{C}$ may be achieved by averaging two or more carefully read, well-calibrated thermometers. Some investigators have used hydrometers ($\pm 0.2^{\circ}/\text{oo}$) and refractometers ($\pm 0.5^{\circ}/\text{oo}$) for the determination of salinity, but up to 1960 salinity was usually obtained by titrating the water samples drawn from the bottles; replicate titrations in the hands of a good operator could yield results precise to $\pm 0.01^{\circ}/\text{oo}$. In the 1960's, salinometers measuring salinity via the conductivity of the sample replaced titrations. A precision of $0.003^{\circ}/\text{oo}$ can be obtained with the better instruments, although in the past, systematic errors of $\pm 0.02^{\circ}/\text{oo}$ or more could be introduced by variations in the standard water used to calibrate these instruments. New international standards for salinity should eliminate the latter source of error (Lewis and Perkin, 1978).

5.1.2 CTD DATA

CTD data are data produced by in-situ profiling instruments variously called STD (salinity-temperature-depth), STP (salinity-temperature-pressure), CTD (conductivity-temperature-depth) or CTP (conductivity-temperature-pressure) profilers. Fundamentally, all are CTP devices; the variations in output and name depend solely upon the degree of internal data processing. All instruments perform the same basic function of measuring (more or less continuously) temperature and conductivity as a function of depth. The precision achievable with such devices depends upon the individual instrument. The best are capable of a precision of $\pm 0.005^{\circ}\text{C}$ and $\pm 0.005^{\circ}/\text{oo}$, although accuracy in salinity, until recently, was limited to approximately $\pm 0.02^{\circ}/\text{oo}$ because of the inconsistencies in salinity standards and definitions (Walker and Chapman, 1973).

5.1.3 BATHYTHERMOGRAPH

The bathythermograph (BT) is a thermo-mechanical device which measures water temperature as a function of pressure. Information is produced as a trace on a smoked glass slide which can be read to an accuracy of $\pm 0.2^{\circ}\text{C}$ and ± 2 m depth if the instrument is well calibrated. The BT was widely used in conjunction with reversing thermometers but has largely been superseded by the CTD.

5.1.4 SELF-RECORDING CURRENT METERS

By the 1970's oceanographers could practically and reliably place and recover self-recording current meters in the water column. In the Arctic, such meters are moored from the sea floor, or hung beneath the ice surface. Meters of this type generally record internally on magnetic tape (in some models photographic film or paper charts were used) or, rarely, telemeter data to a ship- or shore-receiving station. They generally provide time series of current speed and direction, and may have other sensors (for measuring temperature, pressure or conductivity) mounted as well. Current speed and direction are usually measured by one of two methods: either by a propeller or rotor for measuring speed and a vane for direction sensing, or by measuring two orthogonal components of the current speed. Component speeds may be measured by propellers, or by electromagnetic or acoustic speed sensors. Direction reference is provided either by a magnetic compass or in the case of instruments mounted from ships or from the ice, by using torsionally-rigid suspension materials which allow directional reference to be fixed at the surface. Commonly used instruments employing the propeller and vane system are the Aanderaa, Hydroproducts, Endeco and AMF Vector-Averaging current meters; those employing the component measuring system are the Cushing and Marsh-McBirney instruments (electromagnetic), the Neil Brown (acoustic), and the Davis-Weller (orthogonal propellers) instruments.

The precision and accuracy of current meters depend to a great degree both on the design of the instrument, and on the environment in which it is used. Serious problems are encountered if rotor-type meters are used in the wave zone. Calibration drift and sensor fouling can interfere with satisfactory operation of electromagnetic and acoustic sensors. The sampling frequency and integration period selected for the meter can also affect the accuracy of the record.

Special problems in direction measurement are encountered when using compasses in the Canadian Arctic and northern Canada Basin because of the weak horizontal component of the magnetic field due to the proximity of the magnetic pole. Directional accuracies are generally degraded unless the current meter is oriented at the surface via rigid coupling.

5.1.5 PROFILING CURRENT METERS

These current meters provide a series of point measurements of current speed and direction at several depths throughout the water column. Meters used for this purpose are generally of the propeller- or rotor-and-vane design, the oldest common example being the Ekman meter. Measurements usually are taken from the ice, or from an anchored ship in shallow water. In water too deep for anchoring, a very good positioning system is required to correct for ship movements. The directional precision of the measurements can be degraded by the proximity of the magnetic pole. Unless repeated profiles were taken so as to form a time series, this type of data was not generally catalogued.

5.1.6 SATELLITE-TRACKED DRIFTERS

Satellite-tracked drifters are a comparatively recent invention, dating from the early 1970's. Widespread use of these devices began after the launch of the Nimbus VI satellite carrying the Random Access Measurement System

(RAMS) in 1975. In early 1979, the TIROS-N satellite was launched activating System ARGOS which is now used to track all devices.

Both RAMS and System ARGOS compute position from the Doppler shift of a signal transmitted from the buoy to the satellite. On each pass of the satellite the position (and any other data being measured) is received and sent to a ground facility where the data are processed. The RAMS system produced positional accuracies of approximately ± 2 km. Prior to summer, 1978, RAMS produced an average of 8 valid fixes per day in northern latitudes. During the remainder of 1978, the number of fixes per day declined to 4 and then to 2 by the end of the year. The ARGOS system has an average positional accuracy of ± 1.2 km, and produces an average of 10 valid position fixes per day in northern latitudes (Fissel, 1980).

5.1.7 RADAR OR AIRCRAFT-TRACKED DRIFTERS

This type of drifter usually consists of a float (with or without a drogue) and a radar reflector or visual marker. These devices can be tracked visually or by radar from shore or from a ship or aircraft. The accuracies achievable depend upon the tracking system used, and can be very good if a sophisticated system is available. Data of this type are often limited in their coverage in space and time, and may have gaps resulting from bad weather.

5.1.8 WATER-LEVEL GAUGES

Water-level data are produced mainly by visual observation of tide staffs, by mechanical shore-mounted float-type gauges, or by bottom-mounted pressure gauges. The pressure gauges may be self-contained, or they may consist of a pressure sensor connected to a shore-mounted recording device. The mechanical gauges record by means of a pen on chart paper. The data are usually digitized at hourly intervals, resulting in a record with a resolution of approximately ± 1 cm, and an accuracy of the order of ± 5 to 10 cm. The resolution of the bottom pressure gauges varies from a millimetre to a centimetre, depending upon the instrument type and range. Sampling intervals generally vary between 5 and 60 minutes. Unless corrections are made, bottom-pressure records will also contain signals caused by variations in atmospheric pressure.

5.2 DATA RATING SCALE

5.2.1 RATING CRITERIA

The data appraisal in this inventory is intended to provide the reader with an indication of the quality of each data set and its suitability for comparison with other data sets. The appraisal was based primarily on documentation describing the methods used in collecting and processing the data and the investigator's estimate of its precision, accuracy and utility. Subsequent analyses of the data were also taken into account, i.e. if errors were found in a particular data set during a subsequent analysis, and the results were published, they were used in the assessment.

The information from the sources above was used to assign a numerical rating to each set. The rating system has five levels, defined as follows:

0: data are found to be wrong.

1: data suspect because of ill-defined doubts.

2: insufficient information, was not or could not be investigated.

3: data are internally consistent - patterns or trends within data probably real but comparison with other data sets may pose problems.

4: data are internally consistent and exhibit sufficient standardization that comparison with other 4 rated data should be possible.

5.2.2 ASSIGNMENT OF RATINGS

0 RATING

A data set received a zero rating if serious deficiencies in technique, or significant systematic errors occurred. A zero rating was also assigned if the documentation of the data set was lacking essential information (e.g. if the positions and times of measurements were not given) which no longer exists.¹

1 RATING

A data set received a 1 rating if, either as part of a data report or in subsequent analysis and examination, the original or other investigators questioned the validity of the data without pinpointing specific errors. In general, a 1 rating was assigned if a data set exhibited an atypical distribution of values, or indicated unlikely physical processes, but contained no obvious errors. Such data sets require careful examination before use.

2 RATING

Ratings of 2 were given to data sets for which it was not possible to carry out an appraisal. Such cases include:

- (i) Proprietary data, whose existence is known, but about which no details are available.
- (ii) Data sets for which we were unable to obtain documentation, but know that data were collected.

3 RATING

Data received a 3 rating if they were internally consistent within the precision of the methods used to collect the data. Precision is a measurement of the degree of random fluctuation experienced when a measurement is

¹Note that this definition of this number has been modified from that used in Volumes 1, 3 and 5 in order to emphasize that data sets assigned a 0 rating are either wrong or of very limited value due to lack of documentation.

repeated many times, while accuracy is the departure of the measurement (or the mean of a series made under controlled conditions) from the true value. Because oceanographic data are normally taken without replication and under uncontrolled conditions, data taken with instruments of a certain precision will have the same (or poorer) level of accuracy. An exception is the case of a series of temperature-salinity measurements taken within a water body of stable, well-defined characteristics, in which case the mean of the measurement series could provide a measurement more accurate than the precision.

Ratings of 3 were given to all data sets for which no evidence of errors beyond the precision given in Table 1 was found, but which did not satisfy each of the criteria required for a rating of 4 (see below). In some instances, the instrument and/or precision and accuracy were unknown; however the collecting agency used standardized methods. These data sets were generally awarded a 3 rating when there was no evidence suggesting deficiencies in the data.

Caution should be exercised when comparing two sets of 3-rated data, as their levels of precision may be quite different. The reader should consult both Table 1 and Appendix 1 for precision and error information.

4 RATING

Data received a rating of 4 if these data were measured to the precision available with modern methods described in Section 5.1; had no evidence of systematic or other errors recorded in the documentation; and were obtained using measurement instrumentation, methodology and techniques which provide data that can be related to national or international standards.

Since standards tend to change, ratings of 4 were only grudgingly awarded. In many cases, ratings of 3 were assigned because of lack of time and/or sufficient documentation to be certain that a rating of 4 was applicable. Some of these ratings may merit an increase to 4 after further study of the data has been made.

Of all the physical-oceanographic data that were inventoried, the bulk of the data is temperature/salinity measurements. Until the early 1960's, water samples were collected with bottle casts and salinity was determined by titration. During the 1960's, salinities were generally determined using conductivity bridges. From the late 1960's on, instruments which measured conductivity and temperature in situ (CTDs) became the standard. Salinity was then computed from the temperature and conductivity values.

CTDs with increased resolution have revealed gradations in salinity where previous chemical analyses indicated homogeneous water. Since both bottle and CTD data may have ratings of 3, caution must be used in any comparison.

Both methods of salinity determination depend on a standard (usually 35⁰/oo Copenhagen water); variability in the calibration of the instrumentation has in the past resulted in systematic errors of 0.02⁰/oo or more. In the past, replicate samples have been sent to various labs and the

salinities determined by these labs differed by 0.01 to 0.02‰/‰.

A new, practical salinity scale, where waters of the same conductivity ratio have the same salinity, has been adopted (Lewis and Perkin, 1978); this reduces systematic errors in salinity. However, most of the historical data remains subject to a ± 0.02 ‰ accuracy limitation.

Current-meter data were judged by the instrument characteristics, response, and the deployment methods. The main causes of low ratings are directional errors due to inadequate compensation for the weak horizontal component of the earth's magnetic field, and contamination by mooring motion and wave orbital velocities.

6. SUMMARY OF DATA COVERAGE

6.1 SPATIAL COVERAGE, INCLUDING DATA DISTRIBUTION MAPS

The locations of temperature-salinity (Figure 3) and current-meter/water-level stations (Figure 4) reveal a much higher concentration of measurements over the Alaskan shelf/slope region than elsewhere. Most of these stations were occupied since 1970, to provide environmental data related to offshore oil exploration. The station distribution closely resembles the maximum extent of open water during the summer.

The hatching shows the area covered by the 1975-1976 AIDJEX project, during which extensive temperature-salinity and current data were obtained.

The station concentration offshore is much reduced from that along the Alaskan shelf. Most of the data here were obtained by drifting ice stations (mainly Soviet and U.S.) and also by aircraft landings. The movements of the drifting stations were largely governed by the Beaufort Gyre which produces a clockwise (anti-cyclonic) circulation about the Canada Basin. Ice stations tended to be established near the periphery of the gyre, accounting for the lack of data near the center of the Basin. Figure 5 is a composite of Soviet ice station trajectories illustrating the clockwise circulation. Note the surface divergence near 85°N, 120°W. Ice stations either turn clockwise and follow the Beaufort Gyre, or move east with the Transpolar Drift Stream.

Studies concentrating on the Lomonosov and Alpha ridges have resulted in relatively high station densities over these bathymetric features.

In contrast to the Alaskan Shelf, the shelf/slope region off the Queen Elizabeth Islands has been sparsely sampled.

6.2 SEASONAL COVERAGE, INCLUDING BI-MONTHLY MAPS

Temperature-Salinity Data

The seasonal distribution of physical oceanographic data collection peaks during July-August and reaches a minimum during the January-February period (Figure 6). This parallels the seasonal variation in total open water and in solar insolation. Particularly along the Alaskan nearshore, optimum conditions for data collection occur during summer when the polar pack has retreated from the shelf area (Figures 7g and 7h).

The monthly distribution of temperature-salinity data (Figure 7) at offshore locations is more uniform, because ice stations are generally occupied for long periods of time. For example, Ice Island T-3 was occupied off-and-on by various groups from 1952 to 1973 (Figure 8). In addition, Soviet investigators have had at least one ice station in operation continually since 1954 (see Section 12.2).

Current-Meter and Water-Level Data

The bi-monthly distribution of current-meter and water-level stations also peaks in July-August; however the ratio of maximum to minimum number of stations is not as large as for bottle/CTD stations (Figures 6 and 9). This is because current-meter and water-level gauges are moored for longer periods of time, generally on the order of months. Many are left over winter, to be recovered during favorable spring conditions.

6.3 SYNOPTIC DATA SETS AND EXTENDED TIME SERIES

Synoptic Data Sets—Temperature/Salinity Data

In some years the existence of two or more data sets collected at the same time provides a combined data set with near-synoptic coverage over a relatively large area. Data sets were considered near-synoptic if their measurement periods overlapped significantly. The combined data sets may improve coverage within a given area, extend coverage to a larger area or allow comparison of simultaneous processes in different areas. The table below lists near-synoptic data sets by year and general area of coverage. Only temperature/salinity data are considered. Data sets followed by a question mark indicate uncertainty in the time period or location of the measurements. Synoptic groupings within the same year are separated by a solid line.

Extended Time Series

Repeated measurements in the same area may allow long-term trends to be detected and levels of variability to be estimated. Repeated temperature and salinity measurements have been made in several areas. The table below lists the areas in which time series are available. Data sets followed by a question mark indicate uncertainty in the area or the type of measurements made.

6.4 CONCLUSIONS

This catalogue of physical oceanographic data for the Canada Basin allows oceanographers and others to determine the coverage and quality of data pertaining to their areas of interest. The inventory at present contains 340 data sets which have been collected largely by U.S., Soviet or Canadian agencies, or by contractors working for oil companies. Unfortunately, little is known of much of the Soviet data or of data collected by U.S. and Soviet submarines (see Section 12).

Most of the data has been collected during the June-through-October period, particularly over shelf regions when conditions are most favorable. Stations are most concentrated along the Alaskan coast, with secondary concentrations over the Lomonosov and Alpha ridges.

An official request has been sent to the Soviet authorities, through MEDS, asking for information on data they have collected in this area. These data sets, along with an unknown quantity of data collected by submarines, represent a large deficiency in our compilation of existing data. Even once this information is obtained, it is anticipated that more difficulty will be encountered in obtaining the actual data.

8. DATA INVENTORY TABLE

Table 1 presents a summary listing of the data sets included in this inventory. The table lists all the data contained in the inventory sequentially by data set number. Water property, moored current meter, surface drift and water level data are fully catalogued. BT data, because of their limited usefulness in Arctic waters without accompanying salinity data, have not been catalogued in detail. However their existence has been noted in Table 1, and their general distribution may be deduced from the pattern of stations for a particular cruise, as they were usually collected at and along the track between stations. Over-the-side current measurements of short duration made with fixed-depth or profiling current meters have not been fully inventoried. Attempts were made to include all such data covering a tidal cycle or more.

Each column of the table contains the following information (symbols and abbreviations used in each column are explained as well):

Column 1 - Data Set I.D.

- contains the data set identifier number, which is of the form yy-nnnn, where yy are the last two digits of the year in which the data set was collected, and nnnn is the sequential number of the data set for that particular year. (The series of data set numbers applies to the whole set of inventories; gaps may appear in the sequence in any one inventory where data sets exist only in other areas or disciplines. A data set which appears in two or more areas or disciplines will have the same number in every case.) Data sets may be sub-divided by the addition of a letter at the end of the number. Sub-divisions apply only within this report and are used to separate specific types of physical oceanographic data within a single cruise or study.
- spring U.S.S.R. aircraft surveys (Sever series, see Section 12) have been assigned I.D.'s "YR-?", if no information was available. It is believed that these surveys were annual, however the survey may not have extended into this area.

Column 2 - Ship or collecting agency

- contains the name of the ship (underlined), platform and/or agency.

Column 3 - Dates of measurements

- gives the dates spanning the period during which measurements were taken in the area covered by the inventory. The year is given by the first two digits of the data set number in column 1, unless the measurement period spans the end of a year, in which case it is given explicitly. Question marks mean the dates could not be confirmed, generally due to poor/lack of documentation.

Column 4 - Quantity measured

- lists the physical parameters measured in the data set. A quantity followed by a ? means that reference to such a measurement was made but no supporting details were available. Measurements identified as

"Current" are Eulerian, fixed current measurements; "Current drift" refers to Lagrangian measurements. "Current profiles" are spot measurements at certain depths.

Column 5 - Instruments or methods used

- lists the instruments and methods used to make the measurements. The entries appear opposite the names (in column 3) of the quantities they measure. A question mark after the entry denotes an assumption, i.e. that the method used was not explicitly stated and an assumption was made from standard practice at the time. A question mark alone means that the instrument used is unknown. In such cases, a question mark will also appear in the next column regarding the accuracy/precision.

Column 6 - Estimate of data precision and accuracy

- lists the estimates of the precision (repeatability) and accuracy for each instrument opposite the entry for that instrument in column 5. For instruments of a digital nature, the precision specified is based on the resolution of the instrument. Where possible, estimates made by the original investigators are used. They are entered as two numbers of the form $\pm n_1, \pm n_2$ where n_1 is the precision and n_2 the accuracy. Where investigator's estimates were not available, the following special symbols and entries have been used:

$[\pm n_1, n_2]$: standard oceanographic methods were used, which would normally result in these values. The techniques and precision/accuracy used in this context are:

BT	$[0.2^\circ, 0.2^\circ]$
Reversing thermometer	$[0.02^\circ, 0.03^\circ]$
Salinity - Hydrometer	$[0.2^\circ/\text{oo}, 0.2^\circ/\text{oo}]$
Salinity - Refractometer	$[0.5^\circ/\text{oo}, 0.5^\circ/\text{oo}]$
Salinity - Titration	$[0.02^\circ/\text{oo}, 0.04^\circ/\text{oo}]$
Salinity - Bench salinometer	$[0.01^\circ/\text{oo}, 0.02^\circ/\text{oo}]$

$\pm n_1 @$: manufacturer's specifications for that instrument.

$\pm n_1 ?$: an estimate has been given which is questionable for reasons detailed in Appendix 1.

The column is blank where no information was available and no reasonable assumption could be made.

Column 7 - Data rating number

- carries the data rating number assigned as explained in Section 5.

Column 8 - Area

- lists the sub-areas in which the majority of the measurements in the data set were taken. (The sub-areas are defined in Figure 1.)

Column 9 - Concurrent measurements

- lists known measurements in other disciplines taken as part of the data set. Other measurements may have been taken which were not discovered while cataloguing the physical oceanographic data.

Column 10 - Source or reference

- lists a primary source or reference for the data sets. Data sets held in the data banks at the Marine Environmental Data Centre, Ottawa or at the National Oceanographic Data Center, Washington D.C. are identified, respectively by the entries MEDS# and NODC# followed by the data bank's identity number. A MEDS number alone does not necessarily mean that the data are not stored at NODC. If MEDS does not have the data then a NODC number is given if stored there. Appendix 2 lists addresses and contacts for these sources. Water level data having a National Ocean Survey number may be obtained from the National Ocean Service/NOAA, Rockville, Maryland.

TABLE 1: SUMMARY LISTING OF DATA SETS

Data Set I.D.	Ship or collecting agency	Date of measure-ments	Quantity measured	Instruments or methods used	Estimate of data precision and accuracy	Data rating number	Area	Concurrent measurements	Source or reference
1883-1	INT'L POLAR EXPEDITION	Feb. 26-June 10?	Water level	Pulley & Scale	± 3.7 cm	3	Point Barrow		Ray (1885), Harris (1911) National Ocean Service #9494881
05-0001	PEARY POLAR EXPEDITION	Nov. 4-Dec. 2	Water level	Tide staff	$[+1-3, ?]$ cm	3	N. Ellesmere Island		Harris (1911)
06-0002	ANGLO-AMERICAN EXPEDITION	Oct. 21-Dec. 12	Water level	Tide staff	$[+1-3, ?]$ cm	3	Plaxman Island (Alaskan coast)		Harris (1911), National Ocean Service #9498381
08-0004	PEARY POLAR EXPEDITION	Nov. 12, 1908-June, 1909	Water level	Tide staff	$[+1-3, ?]$ cm	3	N. Greenland, Ellesmere Island		Harris (1911)
13-0001	KARLUK, CANADIAN ARCTIC EXPEDITION	-Samples sunk with ship-					Plaxman Island to Wrangel Island	Sediment, benthos, soundings	McKinlay (1976)
14-0002	CANADIAN ARCTIC EXPEDITION	Jan. 16-May 12, 1914; June 2-3, 1916	Water level	Recording gauge tide scale	± 3.7 cm $\pm 7.5, ?$ cm	3	Collinson, Martin, Demarcation points, Cape Isachsen		Dawson (1920)
35-0001	ST. ROCHE, LARSEN OF THE R.C.N.P.	July 17-31	Temperature (Surface) Salinity (Surface)	Reversing thermometer Hydrometer	$[+0.2, .03^{\circ}]$ $[+2, .20/00]$	3	Alaskan Shelf	Biological: cumacea, hydroids, decapoda, polychaeta	Tully (1952)
37-0001	ST. ROCHE, LARSEN OF THE R.C.N.P.	Sept. 5-6	Temperature (Surface) Salinity (Surface)	Reversing thermometer Hydrometer	$[+0.2, .03^{\circ}]$ $[+2, .20/00]$	3	Alaskan Shelf	Biological: cumacea, hydroids, decapoda, polychaeta	Tully (1952)

9. MAPS

This section contains maps showing the yearly distribution of temperature, salinity, current, water level, and surface drift measurements. Up to eight base maps are used, as shown in on the following page. All maps are Polar Stereographic Projection with the following scales:

Map No.	1	2	3	4	5	6	7	8
N, Scale=1:N million	12	7.5	7.5	3.2	1.7	1.7	.175	.175

Temperature-salinity and water level data are plotted together if no current meter data existed in that year. If current meter data were collected in that year, then the first map(s) will show only temperature and salinity data, and a second map will show the current meter data, as well as any water level or drifter data. The areas of Lagrangian drifter data are indicated by hatching on the first map.

Often the actual station locations for the Soviet drifting ice stations are unknown. In such cases, the ice station trajectories have been drawn on the appropriate maps. The entire ice station drift is shown on each year's maps, for all the years encompassed by the drift. This was necessary since the yearly breakdown of ice station drifts was usually not known.

For some data sets, exact locations are not known. A "?" on the first map is used to indicate the general area, if known.

The legend indicates the following data types:

CM - current meter data
 DRF - drifter data
 TS - temperature-salinity data
 WL - water level data

The coastlines have been smoothed and small islands removed. A minimum displacement of .03 m is required for a new station to be plotted. This was implemented to prevent the plotter from wearing through the paper in heavily sampled locations. Vessel/agencies in the legend are abbreviations. Note that cruise station symbols may be different on two different maps. Depth contours are in metres.

10. INDEXES

This section contains three indexes to the data sets. The first is a geographical index which provides a listing by sub-areas (Figure 1). All data sets with any measurements in a particular sub-area are listed by number under that sub-area.

The second index classifies the data sets by measurement type, under the following headings:

Temperature and salinity-bottle	: measurements at discrete points in the water column
Profiles of temperature and salinity	: measurements made with a profiling instrument such as a CTD
Water levels, bottom pressure	: measurements from shore-based tide stations or bottom pressure gauges
Eulerian currents	: measurements of current velocity at a fixed point with a current meter

The third index lists references for each data set by number. The data set number appears at the left hand side of the page, with references listed to the right. The main references are listed followed by other interpretive or analytical references, indented with respect to the main references. The list of interpretive or analytical references may not be complete.

11. LISTING OF MEASUREMENT LOCATIONS AND OTHER PARAMETERS, BY YEAR

This section gives detailed listings of measurement locations and times for each of the data sets plotted on the maps in Section 9. (Drifter data sets whose measurement locations were plotted as shaded areas only are not listed.) There are separate listings for temperature-salinity data, current meter data and water level data. Each listing is ordered by data set number. An explanation of the format appears at the start of each listings. Only data collected within the area of this inventory is listed here; measurements taken elsewhere may be found in the inventories for those areas. The 1975-1976 AIDJEX temperature-salinity and profiling current meter dare are listed separately in sections 11.4 and 11.5, respectively.

11.1 TEMPERATURE-SALINITY DATA

The listings contain the following information:

AREA	General area of station.
STN	Station number; wherever possible it is the station number assigned in the original data source.
LAT, LONG	In degrees and minutes.
YR	Year
MO	Month
DY	Day
HR	Hour; GMT unless specified otherwise
CAST TO	Maximum depth of data, in metres.
WATER DEPTH	In metres, if available.
PARAM MEAS	Parameters measured - conductivity, salinity, temperature. Each parameter measured is qualified by one of the following: X - measurements of this parameter were made CA - possible calibration problems S - suspect readings C - constant readings over parts of record O - zero or obviously bad readings
INSTR	Instrument type: AAND - Aanderaa current meter AMS - Applied Microsystems CTD APL - Applied Physics Lab. CTD BECK - Beckman BISS - Bisset Berman STD BOTT - bottle sample GLDL - Guildline CTD HYD - Hydrometer HYDR - Hydrolab salinometer HYT - Hytech induction salinometer INTO - Interocean CTD MART - Martec data logger NB - Neil Brown RS5 - Beckman RS5 YSI - Yellow Springs Instruments Co.
INT(HR)	The time period between repeat stations.
NO	The number of repeat stations.

Blank entries indicate unavailable or inapplicable data.
? implies suspect data, but the only/best data available.

11.2 CURRENT METER DATA

The listings contain the following information:

AREA	General area of station.
STN	Station number; wherever possible it is the station number assigned in the original data source. Multiple meters are differentiated as 1.1, 1.2, 1.3, for example.
LAT, LONG	In degrees and minutes.
START/STOP	Year, month and day instrument recorded over.
EFF LEN	Effective record length, days of both speed and direction data.
DT (MN)	Sampling rate in minutes.
DEPTHS-INSTR/WATER	Instrument and water depth, in metres.
INSTR TYPE	Instrument type: - AAND - Aanderaa RCM-4 or RCM-5 - AMF - AMF vector averaging - BR - Braincon meter - CUSH - Cushing electromagnetic - ENDE - Endeco - GEOD - Geodyne - GO - General Oceanics - HYDR - Hydrowerstattten - HYPR - Hydro Products - MARA - Marine Advisors - M-MC - Marsh McBirney electromagnetic - NB - Neil Brown acoustic current meter - RICH - Richardson - SETR - Sea-Track current meter
ADDIT SENSOR	Other parameters measured - pressure, temperature, conductivity. Each measurement is qualified by one of the following: - X - measurements of this parameter were made - CA - possible calibration problems - S - suspect readings - C - constant readings - O - zero or obviously bad readings

Blank entries indicate unavailable or inapplicable data.
 ? implies suspect data, but the only/best available.

11.3 WATER LEVEL DATA

The listings contain the following information:

AREA	Area
STN	Station number; generally as assigned by the originating agency.
LAT, LONG	In degrees and minutes.
START/STOP	Year, month and day instrument recorded over.
EFF LEN	Effective record length.
DT (MN)	Sampling rate in minutes.
INST & WATER DPTH	In metres.
INSTR TYPE	AAND - Aanderaa AMS - Applied Microsystems BASS - Bass Engineering optical lever LEOP - Leopold Stevens MECH - shore-based gauge, temporary or permanent OTT - Ott gauge, either float or potentiometric SDAT - SeaData STAF - Tide staff STEV - Stevens
ADDIT SENSOR	Parameters measured qualified by: X - measurements of this parameter were made CA - possible calibration problems S - suspect readings C - constant readings O - zero or obviously bad readings

Blank entries indicate unavailable or inappropriate data.

? signifies data which are either unknown or may be suspect. For example, a location which plots on land.

11.4 AIDJEX 1975-1976 TEMPERATURE-SALINITY DATA

This sections contains listings of all the AIDJEX 1975-1976 temperature-salinity data, even those stations outside the boundaries of this data compilation.

The format of the T/S data listing is the same as in Section 11.1. The station letters CB, BF, SB and BB signify camps Caribou, Blue Fox, Snowbird and Big Bear, respectively.

11.5 AIDJEX 1975-1976 PROFILING CURRENT METER DATA

This section lists the profiling current meter stations from AIDJEX 1975-1976. All the stations are presented, even those outside the boundaries of this compilation.

The following headings are used:

AREA	General area of station
STN	Station number CB - Caribou Camp BF - Blue Fox Camp SB - Snowbird Camp BB - Big Bear Camp
LAT, LONG	In degrees and minutes.
YR	Year
MO	Month
DY	Day
HR	Hour (GMT)
PROFILE TO	Maximum data depth (m); * indicates a time series of measurements.
PARAM MEAS	Parameters measured - pressure, current speed and direction. Qualification symbols are X - measurements of this parameter were made CA - possible calibration problems S - suspect readings C - constant readings over parts of record O - zero or obviously bad readings
INSTR	Instrument type: TSK-Tsurumi-Seiki Co.

PROFILING CURRENT METER DATA SET NUMBER: 75-0005
 YEAR: 1975 VESSEL/AGENCY: AIDJEX

12. INACCESSIBLE DATA SETS

12.1 OCEANOGRAPHIC DATA COLLECTED USING SUBMARINES

In 1931, the Nautilus became the first submarine to attempt to enter the Arctic Ocean. Lack of upward-scanning sonar restricted penetration to only a few yards under the ice (Sverdrup and Soule, 1933). The capability for conducting standard oceanographic observations by lowering a cable through the hull from a pressurized compartment was demonstrated at this early date.

Following World War II, renewed efforts were made to adapt submarines for use under sea ice by the U.S. Navy Electronics Laboratory. New developments in sonar techniques lead to the safe operation of the U.S.S. Bearfish and U.S.S. Carp under the ice in the Chukchi Sea in 1947 and 1948. With the advent of nuclear-powered submarines in the 1950's, submarine travel for extended distances became feasible without the need to surface. In 1957, the nuclear submarine U.S.S. Nautilus spent 5.5 days under the ice in the Canada Basin, reaching the latitude 87°N. This same submarine crossed the Arctic Ocean, beginning at Bering Strait and passing over the North Pole in August 1958. In both of these cruises, scientists from the U.S. Naval Electronics Laboratory were onboard carrying out unspecified scientific investigations (Polar Record, Vol. 9, p. 143, 1958; Polar Record, Vol. 9, p. 340, 1959).

U.S. Navy submarine operations in the Arctic Ocean as described by Lyon (1963; 1984) are summarized in Figure 10. Measurements of ice thickness, water temperature, electrical conductivity and optical transparency as well as ambient light, earth's gravity, plankton population and bathymetry were routinely measured during these cruises by instruments carried on or within the hull. Lyon (1963) remarked on differences in the oceanographic capabilities of diesel- and nuclear-powered submarines:

"Conventional, deep oceanographic stations were taken during Arctic cruises of diesel-battery submarines by overside casts using a winch mounted in the forward torpedo room (Plate III). However, stations have not been taken during cruises by nuclear submarines because: (a) overside rigging is highly inconvenient and impossible under winter conditions; (b) time for stations is not compatible with need for maximum areal coverage in available time, and (c) no mercurial devices are permitted on a nuclear submarine because of possible contamination of ship's atmosphere by accidental breakage. Sverdrup demonstrated in 1931 the feasibility of using an air lock and winch for lowering an oceanographic cast from within the submarine. For the submarine cruises to date, the high cost of modifying the hull to accommodate an air-lock system was not justified, but possibly should be considered in long-term programs. However, for taking oceanographic stations we intend to use a precision electrical sensing element lowered by a winch mounted in the submarine's superstructure and controlled from within the hull."

The extent to which the recommendations were subsequently implemented in terms of using an air lock and winch are not known.

Figure 10: Maps illustrating (upper) the tracks of the under-ice cruises of USS Nautilus, Skate, Sargo and Seadragon, 1957-1962 (from Lyon, 1963) and (lower) a composite of U.S. submarine tracks from 1957 to 1982 (Lyon, 1984).

Since the time of Lyon's (1963) paper, the waters of the Arctic Ocean have been routinely patrolled by U.S. submarines. A large amount of oceanographic data has likely been collected during these voyages, but information concerning these data is sparse due to the classified nature of the submarine operations.

The primary navigation system used by U.S. submarines operating in the Arctic is an inertial navigational system supplemented by observations obtained from navigation satellites (Lyon, 1984). However, the positional accuracy may be poor, particularly for data collected in the 1950's and 1960's. Based on comparisons of bathymetric features measured from submarines and more accurate measurements obtained from the LOREX experiment 1979, Weber (1983) notes apparent errors of up to 40 km in the Skate and Nautilus tracks of 1957-1962. Beal (1983) confirms that large positional errors could occur due to the reliance on the Ship's Inertial Navigation System. According to Beal (1983), this situation has persisted "until recently, since availability of nearly continuous satellite navigation".

A literature search, including computer-based scanning of automated data bases (Oceanic Abstracts, EI Engineering Meetings, Compendex, National Technical Information Service and Enviroline) yielded only a few reported instances of oceanographic data collected by submarine in the Arctic Ocean:

- Freidman et al. (1961) reports on the deuterium content of surface water samples collected near the North Pole in 1958, from the submarine U.S.S. Skate (data set 58-0013).
- Grice (1962) describes plankton populations from data collected from the U.S.S. Seadragon cruise to the North Pole in 1960.
- Wadhams (1977) describes sonar measurements of ice keel depths obtained from the nuclear submarine HMS Sovereign obtained during a cruise to the North Pole in October, 1976. On this same submarine cruise, sound velocimeter measurements were used to compute temperature records; an analysis of these data in the East Greenland Sea Polar Front is presented in Wadhams et al. (1979).
- LeShack (1981) presents an analysis of under-ice roughness with satellite and airborne thermal infrared data collected in the Beaufort Sea (February 1960 cruise of the U.S.S. Sargo and April 1976 cruise of the U.S.S. Gunard) as well as the above-mentioned 1976 data from the HMS Sovereign.
- Ostlund (1982) reports on water samples collected in 1978 from the U.S.S. Pintado to compute the residence time of the freshwater component in the Arctic Ocean (data set 78-0044).

These papers are believed to represent only a very small fraction of oceanographic data collected from submarines. The great bulk of these data are not presently available due to the reluctance of the military agencies to release information concerning submarine patrol patterns. During preparation of this report, a request for more information was sent to the Commander of the U.S. Pacific Fleet; the response was to use proper government channels.

Subsequently, a request for this information was initiated through the Marine Environmental Data Services Branch, Department of Fisheries and Oceans, Canada.

The Soviet Union is also believed to conduct submarine patrols under the sea ice of the Arctic Ocean. During the summer of 1962, the Soviet atomic submarine Leninskiy Komsomol reached the North Pole (Smith, 1971). Due to the military nature of the submarine operations, no information could be located as to the extent, if any, of oceanographic data collected from Soviet submarines.

12.2 SOVIET OCEANOGRAPHIC STUDIES

The Soviet Union has been actively involved in oceanographic data collection in the Arctic Ocean from the 1930's to the present. Soviet air-supported drifting ice station operations began in 1937 when an ice station was occupied for nine months (data set 37-0006, Papanin, 1946). This station was later called Severnyj Polyus (North Pole) 1. However, the large degree of sea support for the drifting ice station program was a factor in several vessels becoming trapped in the ice north of Siberia; as a result, enthusiasm for further ice station activity ebbed.

The next North Pole station, NP-2, was established April 1950 (Somov, 1955), and was the first to operate year round. Studies included oceanography, meteorology, sediment collection, as well as magnetic and gravity observations and ice studies.

In 1954, stations NP-3 and NP-4 were established, and from that time to the present at least one North Pole station has been in operation (Table 2). Duration of occupation has varied from several months to several years. In most instance, the stations have been located on large sea-ice floes; however, in more recent years, a greater tendency to operate from the ice islands (e.g. NP-22, NP-23 and NP-24) has been noted.

Other types of data collection programs evolved from the drifting ice station program, as a result of the demonstrated capabilities to use aircraft in the Arctic on a large scale in the support of the NP ice stations. In 1941, stations on the sea ice were occupied by the Soviet-All-Union Arctic Institute (VAI), using a four engine N-169 aircraft. Station occupations lasted 4-5 days and measurements included depth, temperature, salinity, weather, gravity and magnetism.

In 1948, VAI began a program whereby aircraft-supported stations were occupied for about six weeks each spring, and often for a shorter fall period. These yearly aircraft landings are called the Sever (North)-Series. Figure 11 (Laktionov and Shamont'ev, 1957) illustrates the extent of data coverage during the period 1937-1956. These aircraft landings, as well as the drifting NP stations, have continued through to the present. The data collected from these stations beginning in 1974-1975 were part of the Poles North program (National Academy of Sciences, 1974).

Since 1953, the Soviet Arctic and Antarctic Research Institute has carried out a program of meteorological and ice drift data collection from automatic stations located on the pack ice. These data collection platforms, known as DARMS (Drifting Automatic Radio-Meteorological Station) obtain

TABLE 2: SOVIET DRIFTING ICE STATIONS

measurements of air temperature, atmospheric pressure, wind speed and wind direction (Olenicoff, 1971). The data are transmitted to shore stations by radio signals, normally 2-4 times each day. The DARMS signals are received by coastal direction-finding radio stations, which record the meteorological signals, as well as determining station position by simultaneous bearings from two or more shore stations. Between 1953 and 1972, a total of 440 Soviet automatic drifting stations have been deployed in the Arctic.

Beginning in 1972, a new automatic data collection platform was developed containing oceanographic sensors (Olenicoff, 1973). This new platform known as DHARMS (Drifting Automatic Radio-Hydrometeorological Station) includes five new sensors used for measuring water temperature, water salinity, current speed, current direction and ocean depth. In the spring of 1973, three DHARMS units were deployed in the Arctic Basin in addition to 20-25 DARMS. As of 1973 (Olenicoff, 1973), the deployment of ten DHARMS was planned for 1974 as an initial step towards the longer term goal of phasing out all DARMS and replacing them by DHARMS. Unfortunately, more recent information could not be located concerning the use and performance of the DHARMS units.

Sources of Information

The degree of information available for Soviet oceanographic studies is highly variable according to type of activity and the time period in which operations were carried out. Virtually no information could be obtained on Soviet submarine activities due, presumably to the highly classified nature of these operations. On the other hand, a considerable amount of information was available on the very active Soviet research efforts involving drifting ice stations and aircraft-based operations on the sea ice. Comparatively detailed information is available until approximately the time of the International Geophysical Year (IGY 1957-1958) programs involving international scientific cooperation. Unfortunately, since the IGY, the amount of information on Soviet aircraft and drifting ice station activities is considerably reduced and much of the detailed information as to measurement times, locations, types of data collected and methods is sketchy or entirely absent.

In compiling information for this report, a number of useful review articles were located (Treshnikov, 1956; Laktionov and Shamont'ev, 1957; Timofeyev, 1960; Fletcher, 1968; Smith, 1971) which provided an overview of Soviet activities from the first North Pole station (see below) in 1937 to 1956. The best sources of information concerning the times and positions of the establishment and abandonment of drifting ice stations were found in Gordienko and Laktionov, 1960; Gordienko, 1962; Smith, 1971. A valuable supplementary source of information, in this regard, were brief notes appearing regularly in the journal *Polar Record*, published by the Scott Polar Research Institute, Cambridge University, Cambridge, United Kingdom. Plots of the tracks of each of the drifting stations (up to 1979) were obtained from the Soviet World Ocean Atlas, Vol. 3, Arctic Ocean edited by S.G. Gorshkov (1983). While these track plots are useful since, in some cases, they are the only detailed plot available, the atlas does not provide any details as to specific types of measurements, methodology, sampling rates or times along the track.

Procedures for Identifying and Displaying Soviet Ice Station Data

For most of the Soviet ice station data sets, detailed information as to times and position of individual measurements are not available. MEDS files contained such information for only two ice stations NP-2 (Data set 50-007) and NP-22 (73-0034). Timofeyev (1960) is the best source of station location and time information for the period up to 1959. Other sources of such information include: Nikitin and Dem'yanov (1965) - current data from NP-3, 4 and 5; Legen'kov et al. (1974) - temperature data from NP-19; and Melnikov (1976) - plot of station locations for NP-22.

A large number of scientific papers have been published based on the data collected from Soviet ice stations. For example, Laktionov and Romanovich (1962) list 326 papers, for numerous scientific disciplines, written on ice station and high latitude air expeditions. Generally, these papers are of little help in determining where, when and what was measured because the data used are often not explicitly identified as to measurement times and locations, even in the form of maps or tables.

The station information that has been uncovered is generally reported in Moscow time and longitude °E. Longitudes were converted to °W; however the times were not changed since the time zone used was often unknown. Also, only one data set ID has been assigned per expedition. In view of independent studies conducted using the U.S. ice island T-3 (Figure 8), there may be justification for further breakdown of Soviet ice station activity.

A request for additional information has been sent to World Data Centre-B in Moscow, through MEDS. It is not expected that this will prompt immediate results however. These data are important since many of the stations are near Canadian waters. For example, Weber (1983) states that there is evidence that during the early 1950's the Soviets collected data in the channels of the Queen Elizabeth Islands.

The Soviet data sets have been documented as fully as possible. Even if no details were available, the data sets are entered in Table 1, if it was known or suspected that data were collected within this study area. Also, the NP ice station trajectories, obtained from the Atlas edited by Gorshkov (1983), have been drawn onto the maps. One can generally assume that data were collected somewhere along the course of the plotted trajectory. Similarly, the NORTH-series aircraft operations are listed as entries in Table 1, even though in most instances since 1956, virtually nothing is known as to station locations and times, methods, etc.

12.3 U.S. OIL COMPANY DATA

With the discovery of the very large oil field at Prudhoe Bay in 1968, a very active program of exploratory drilling by oil companies began in the late 1960's. The interest of oil companies in offshore drilling led to a large amount of activity in oceanographic research, required to provide engineering design information and to assess possible environmental impacts of offshore drilling for oil and gas. The resulting oceanographic studies were carried out as:

- 1) studies sponsored by U.S. federal and state agencies and either carried out by the same agencies or contracted out to consulting companies and university research groups (e.g. Outer Continental Shelf Environmental Assessment Program, OCSEAP);
- 2) studies sponsored by the oil industry and often contracted out to consulting companies.

For the first category of oceanographic studies, the results are within the public domain, in the form of scientific papers, reports and data files held by the sponsoring and/or collecting organizations, as included in Table 1.

The studies sponsored by the oil industry are not necessarily within the public domain. In many cases, the results have been made public, often as supporting documents in environmental impact studies or through various regulatory hearings (see Table 1). However, some oceanographic studies were identified but information concerning the measurement program was not accessible, as the study was proprietary to the sponsoring oil companies. The primary source of information used in identifying the proprietary oceanographic studies was a document prepared by the Alaska Oil and Gas Association (AOGA, 1983) entitled "A compilation and description of industry research projects in Alaska frontier OCS areas". In this document, a total of 216 projects carried out by the oil industry is briefly described. The description includes the project title, a one-half page presentation of purpose and method, the names of the contractors, and the sponsoring oil companies, title and date of the final report, the cost and the confidentiality status of the results.

For all known oceanographic studies sponsored by oil companies, a request was made to the consulting company for the information required for the data compilation. In most cases, this information was forwarded to us either as tabulated locations and times of oceanographic stations or as a copy of the report. For some projects where the results could not be released by the consulting company without the permission of the sponsoring oil companies, the oil companies were contacted. This resulted in additional detailed information for some data sets. However, for a total of seven data sets, all collected by Oceanographic Services Inc. of Santa Barbara, California, it was not possible to receive the required consent to release information from all of the companies. The response to the requests for information are tabulated in Table 3; in the case of "no response", this was the result of an initial written request and two or three telephone calls. For these particular data sets, an entry is provided in Table 1 and Appendix 1, but there was insufficient information to provide station location plots and listings.

Other oil company data sets are also likely to exist that are unknown to us. Within the project time limitations, we have attempted to identify and obtain as much information as possible, but additional effort may yield more information. There is a need for a better procedure to catalogue the existence of oceanographic studies sponsored by individual oil companies.

APPENDIX 1

REMARKS - METHODS, PROBLEMS AND ERRORS BY DATA SET NUMBER

1883-1 International Polar Expedition/Ray (1885)

A tide gauge at Vglaamie, Alaska (near Barrow) recorded water level every half-hour for 112 days, Feb. 26-June 17, 1883. Harris (1911) states the record length to be 104.5 days, Feb. 26-June 10. The gauge consisted of a weight on the bottom with the line coming through a hole in the ice, and over a pulley, so that the counterweight at the surface moved vertically along a graduated scale. As the water level rose or fell, so did the ice platform and thus the weight against the scale. Readings were made to the nearest 0.3 cm (0.01 ft), and the level of high and low water was also noted. Times recorded were "local mean time". The data are tabulated in Ray (1885). Analyses on hourly values were performed at the U.S. Coast and Geodetic Survey Office.

05-0001 Peary Expedition/Harris (1911)

Twenty-nine days of hourly water levels were recorded at Cape Sheridan (82°27'N, 61°21'W), Nov. 4-Dec. 2, 1905. Analyses were done at the U.S. Coast and Geodetic Survey Office. The change in water level can be measured fairly precisely using a staff (to approx. 1-3 cm); however measurement of the absolute water level depends on the accuracy of the datum. The early explorers probably did not establish any datum.

06-0001 Anglo-American Expedition/Harris (1911)

Fifty-eight days (Oct. 21-Dec. 12, 1906) of hourly water level data were recorded at the south side of Flaxman Island (70°11'W, 145°50'W). Analyses were performed at the U.S. Coast and Geodetic Survey Office.

08-0004 Peary Polar Expedition/Harris (1911)

As part of the Peary Polar Expedition of 1908-1909, hourly water level measurements were taken at several locations along the northern Greenland and Ellesmere Island shores. The purpose was to provide data regarding a possible land mass in the Arctic Ocean. Harris (1911) tabulates the data and discusses the accuracy of the timing. Analyses were made at the U.S. Coast and Geodetic Survey Office:

Cape Sheridan, 82°27'N, 61°21'W, Nov. 13, 1908-May 23, 1909

Cape Columbia, 83°05'N, 69°35'W, Nov. 16-Dec. 14, 1908

Cape Bryant, 82°21'N, 55°30'W, Jan. 15-Feb. 13, 1909

Cape Morris Jesup, approx. 83°37'N, 32°40'W, May 13-23, 1909

The latitude/longitude of the Cape Morris Jesup station was not in Harris (1911) and has been estimated from the GEBCO 5-17 chart (1979).

14-0002 Canadian Arctic Expedition/Dawson (1920)

Tidal data were collected at Collinson, Martin and Demarcation points and Cape Isachsen. Readings were made to typically 0.003 m (0.01 ft). Collinson Point served as headquarters where a large recording tide gauge was used. At the three other sites, 1-4 day records were obtained, and the timing was not as accurate as at Collinson Point. Latitudes/Longitudes were estimated based on the geographic description of the locations.

35-0001 St. Roche/Tully(1952)

T/S data, as well as collections of biological material, were collected by personnel aboard the R.C.M.P. vessel St. Roche while on patrol duty (Tully, 1952). Instruments were supplied by the Pacific Biological Station at Nanaimo. The data and samples were deposited with the Pacific Biological Station in 1938.

Temperatures were measured using reversing thermometers, while salinity was calculated (Knudsen's Tables) on the basis of specific gravities measured by hydrometers. Measurements were made of surface samples only.

37-0001 St. Roche/Tully (1952)

See 35-0001.

37-0005 Northland

The data are on file at MEDS and NODC. However, no supporting documentation has been found. Hufford (1973, p. 2707) performed some analyses on the data, and refers to the vessel as the Northwind, although the NODC file indicates it was the Northland.

37-0006 Ice Island NP-1

The stations appear to be just out of the study area, but are included for the sake of completeness.

In total, 500 water temperature measurements and 300 current measurements were obtained from Ice Island NP-1 (Gordienko, 1962). Generally data from Soviet ice stations are not readily available, nor is information on methods. Timofeyev (1960) tabulates station positions for many of the data between 1937 and 1959. The Soviets have been approached through MEDS for more information. See Section 12.2 for more detail on the inaccessibility of Soviet documentation.

37-0007 Soviet Aircraft Landings on Ice

Aircraft, while supplying the first ice station (later known as NP-1), made several landings on the ice. One of the stations was in the northern sector of this study area. At present, it is not known what observations were made. As Timofeyev (1960) does not include them in his tabulations, it may be that no hydrographic data were collected.

38-0003 Northwind

The data are on file at MEDS and NODC; however no supporting documentation has been found.

41-0001 N-169 Landings

During April, 3 successive flights were made by personnel from the Soviet All-Union Arctic Institute (VAI). The aircraft used was a N-169 based at Wrangel Island. The scientists stayed 4-5 days at each of the three sites (between 78-81°N and 175°E-170°W). They took soundings, and meteorological, gravitational and magnetic observations. Water temperature and salinity were measured (methods as yet unknown) and water and seabed samples were collected (Weber, 1983). This project was the forerunner of the Sever-Series, spring and fall expeditions using aircraft. The Second World War interrupted the project and it was not until 1948 that the flights resumed. Station location information was taken from Timofeyev (1960).

In 1946, Maksimov (1946) studied the tidal temperature and salinity fluctuations obtained during the 1941 expedition and again assumed the existence of shallow water with depth of approx. 1000 m near 81°30'N, 180°W.

45-0001 U.S. Coast and Geodetic Survey

A search of the files of the National Ocean Service (Rockville, Maryland, U.S.A.) indicated that water level data exist for these stations. No supporting documentation has been found. The U.S. Coast and Geodetic Survey, previously the Coast Survey, became the National Ocean Survey in 1970, and then the National Ocean Service in 1982.

47-0002 U.S. Coast and Geodetic Survey

See 45-0001.

48-0006 Northwind

Data are on the NODC system; however no supporting documentation has been found. Hufford (1973) performed some analyses on the data.

48-0007 Somov (1955)/See 41-0001

This was the beginning of the "High-Latitude Air Expeditions", known as the Sever-Series, in which aircraft were used to transport scientists to locations on the ice for short periods. The expeditions covered roughly a six week period in the spring, and sometimes a shorter period in the fall. In 1948, 8 stations were occupied, 3 of which are in the area of this study (one station involved a sounding at 86°26'N, 154°53'E). It was during this survey that the Lomonosov Ridge was discovered. Station location information was extracted from Timofeyev (1960). No supporting documentation has been found.

48-0008 U.S. Coast and Geodetic Survey

See 45-0001.

49-0004 U.S. Coast and Geodetic Survey

The record length is unclear. National Ocean Service files show an installation and removal date of July 17, 1949 and July 15, 1950, respectively. However, their records also indicate only a one-month record is available beginning July 17, 1949.

49-0005 Soviet Aircraft Landings/See 48-0007

Of the 32 ice stations, 23 were in the area of this data compilation (Somov, 1955). Station location information was taken from Timofeyev (1960). Musin (1960) tabulates the data collected from some of the stations.

49-0006 U.S. Navy Electronics Laboratory

Field testing of oceanographic equipment was done at an open lead "in the vicinity of" Point Barrow. Nansen bottles, reversing thermometers and BT's were tested, but no results are reported (U.S. Navy Electronics Laboratory, 1950). Two camps were set up about one mile apart. No exact position or details of the measurements are provided.

50-0001 Burton Island/U.S. Navy H.O. (1954)

As well as the temperature/salinity data, measurement of current velocity and direction were made at several depths using an Ekman meter on Aug. 10-11, 17 and 30-31 off Point Barrow and on Aug. 28 off the Stockton Islands.

50-0007 Ice Station NP-2/Somov (1954-55)

Station positions were determined astronomically. Between Apr. 23, 1950 and Apr. 2, 1951, the following observations were made:

- 17 hydrographic stations
- two 15-day stations for temperature at seven to nine standard depths
- five 1-day stations for salinity at three depths
- two stations for near-surface temperatures (0-10 m)
- one station for complete analyses
- five stations on open water for temperature and salinity of the subsurface layer

Nansen bottles (1.0 and 1.7 litre) were used to collect water samples and reversing thermometers for temperature. Chlorinities were determined at the ice station, except station 2 and 16, which were analyzed at Tiksi Bay and Leningrad respectively.

Current measurements were made at depths of 10, 75, 150 and 1000 m. The ice movement was subtracted out. The meters had rotors and vanes. Rotor revolution was determined by balls in compartments (Ekman-like meters). Currents were also measured using drogue driftmeters. Although these are spot measurements using a profiling current meter, the repeat time was about 3 hours. The result is current data from the four levels, sampled about every 3 hours.

Measurement intervals, start and stop locations, and the nominal position used for plotting are:

Period	Locations		Plot Position
	Start	Stop	
May 3-20, 1950	76°22'N, 169°17'W	76°35'N, 170°25'W	76°35'N, 170°W
July 30-Aug. 15, 1950	78°43'N, 169°58'W	79°04'N, 166°53'W	79°N, 168°W
Oct. 2-Aug. 18, 1950	79°06'N, 160°12'W	80°10'N, 159°04'W	79°30'N, 159°30'W
Jan. 9-25, 1951	80°27'N, 163°22'W	80°52'N, 161°36'W	80°30'N, 162°W
Mar. 13-29, 1951	81°36'N, 161°07'W	81°24'N, 161°00'W	81°30'N, 161°W

Occasional measurements were also made at 4, 25 and 50 m depths. Diurnal (2 day) series profiles were also occupied but are not listed here (see Somov, 1954-55, p. 321-401). Bottom currents (approx. 425 m) were also measured every 1-2 hours between July 4-10 and July 29, 1950 (Somov, 1954-55, p. 402, 403), while crossing the Chukchi Plateau. No locations are given; we have used 78°20'N, 167°W based on Fig. 1 of Somov.

Note that times were recorded as Zone II plus 1 hour (Moscow Daylight Saving).

50-0008 Soviet Aircraft Landings/See 48-0007

Station location information was taken from Timofeyev (1960). No other supporting documentation has been found. Twenty-two of the stations occupied in the spring were in the area of this data compilation.

50-0009 U.S. Coast and Geodetic Survey

See 45-0001.

51-0001 Burton Island/U.S. Navy H.O. (1954)

In addition to the temperature-salinity data obtained from bottle casts, currents were measured at 27 stations using an Ekman current meter for the greater depths and a biplane down to about 30 m. Several hundred observations were made over a few days while at anchor west of Point Barrow.

51-0010 U.S. Coast and Geodetic Survey

Record lengths and methodology could not be determined from the information supplied by the National Ocean Service, Rockville, Maryland.

51-0011 Project SkiJump I/Worthington (1953a)

A U.S. Navy R-4D aircraft made 12 landings on the ice and 3 hydrographic stations were occupied on Apr. 1 and 21 and on May 3. Nansen bottles were used to collect water samples. In 1951, some of the Nansen bottles froze, causing erroneously high salinities. In 1952 (see 52-0009), efforts were made to ensure that the bottles were not exposed to freezing temperatures. Reversing thermometers were used to measure temperatures.

52-0002 Burton Island/U.S. Navy H.O. (1954)

This survey was concentrated east of 141°W longitude (see Cornford et al., 1982). Two oceanographic stations, 32 and 33, were on the Alaskan side. The submarine USS "Redfish" accompanied the "Burton Island" and participated in acoustic experiments.

52-0009 Project SkiJump II/Worthington (1953a)

This was a continuation of the 1951 project (51-0011). In 1952, the range was extended using P-2V aircraft to refuel the R-4D on the ice. Stations 4 through 8 were occupied using methods similar to those of 1951. See the 51-0011 write-up for details.

At station 7 (79°36'N, 147°10'W) at 1000 m, the Nansen bottle did not close properly, causing questionable results.

52-0010 Ice Island T-3/Worthington (1953b)

Between Nov. 29, 1952 and Aug. 1, 1955, eleven hydrographic casts were made from ice island T-3. Stations 1-4 were made by Worthington, 5-8 and 10 by A.P. Crary of the Air Force Cambridge Research Center and stations 9 and 11 by N. Goldstein of the Air Force Cambridge Research Center. Leakage of some of the sample bottles occurred, making salinity data unsatisfactory for 5 stations. Worthington (1953b) reported only the acceptable salinity data. Stations 12-22 on Jan. 4, 1953 were multiple readings of temperature only at 225 m. All water depths are described as approximate.

52-0012 U.S. Coast and Geodetic Survey

Exact dates and methodology are unclear, according to the information received from National Ocean Service.

54-0002 Burton Island

USNHO (1956) and NODC# 3150456 indicate two stations in this area in August and September. However, NODC# 3152465 also has Burton Island as the vessel, with three stations occupied in May. It is not clear if these three stations are actually part of 54-0002.

54-0013 Soviet Aircraft Landings

The air expedition helped set up the NP-3 and NP-4 drifting ice stations, followed by detailed studies made of the Lomonosov Ridge (Shcherbakov, 1954). Fletcher (1968) shows additional stations in the Chukchi Plateau region which are not listed by Timofeyev (1960) nor mentioned by Shcherbakov (1954).

54-0014 USSR Ice Station NP-3

Current measurements were made at 1000 m depth using a BVP-2 meter during two periods: Nov. 7-19, 1954 and Jan. 12-20, 1955. Apparently, the meter was suspended from the ice. No location could be found. We have used the approximate position of the ice station at that time (88°40'W, 70°W).

54-0015 Ice Station NP-4

This station was established at 75°48'N, 178°25'W. It drifted in and out of this study area, along 180°W longitude. Kucherov and Sternzat (1959) discuss apparatus for measuring the temperature of the snow, ice and water; however, the locations of the measurements are not given.

Nikitin and Dem'yanov (1965) discuss current measurements taken with a BVP-2 recorder. Observations were made at the 1000 m depth.

55-0001/55-0016 Northwind/Burton Island

Both vessels are grouped in NODC files under #3150518. Only one station on Aug. 6 is indicated to be Burton Island; possibly this is in error and it was actually a Northwind station. No supporting documentation has been found.

55-0015

Exact dates are unclear (Beal, 1957, 1968a). A 29 day record in August and 7 days in December were obtained. The Leopold Stevens A-25 float recorder had a clock accurate to 1 or 2 minutes over 48 hours. Radio time signals were used to keep the clock accurate. A 5-cm water level change was recorded as a 1-cm change on the chart, i.e. a 5:1 reduction.

55-0017 Soviet Aircraft Landing

See 48-0007.

55-0018

The USHO (1958) atlas indicates stations of the Requisite; however it seems that it was actually the Northwind and Staten Island that collected the data. The data set has been maintained however, since we are not certain that the Requisite did not collect data.

56-0001 Requisite

These data were analyzed by Hufford (1973). Six current measurement stations were also occupied. The data are in an unpublished U.S. Navy Hydrographic Office report of 1958.

56-0012 Soviet Aircraft Landings

Lationov and Shamont'ev (1957) shows more stations (Fig. 11 this report) than listed by Timofeyev (1960). Possibly not all the stations included hydrographic sampling.

56-0013 Soviet Ice Station NP-6

Documentation showing station locations or measurements made could not be found. Therefore the ice island trajectory has been plotted to show where data probably exist. The trajectory is from the atlas edited by Gorshkov (1983).

56-0014 Atka

The data are on the NODC system, however no documentation describing instrumentation/accuracy has been found.

57-0002 Atka

Hufford (1973) analyzed the temperature-salinity data, and also mentions near-surface current measurements.

57-0011 Ice Floe Alpha/Cabaniss (1962), Hunkins (1966a), Farlow (1958), English (1961)

A tethered drogue was used to measure currents relative to the ice motion (Hunkins, 1966a). The vertical angle between the tether and a plumb line provided a measure of current speed; the horizontal angle between the tether and north gave the bearing. The drogue was calibrated theoretically and against a standard current meter.

For stations 11 through 32, Nansen bottles and reversing thermometers were used (English, 1961). Also, detailed temperature profiles were obtained using a thermistor. The reversing thermometers were of poor quality and some obviously wrong readings have been deleted. Water samples were stored in glass bottles; the salinity was determined at Woods Hole Oceanographic Institute by titration.

Farlow (1958) also reports temperature/salinity data from stations 1 through 10. These salinities were also determined at Woods Hole, using a salinometer.

Location and times are for start of cast. Casts often took several days to complete.

Positions were determined from astronomical observations; some interpolation between sightings was required.

57-0012 USSR Aircraft/Nikitin (1958)

Twenty-four aircraft landings were made and hydrographic data were collected at eleven of the stations. One landing was within the study area and therefore, it appears that there is a 50% chance that hydrographic data were collected at this one station.

57-0013 NP-7 Ice Station

No source documents have been obtained. Station information has been extracted from Timofeyev (1960).

57-0014 Ice Station Bravo (T-3)/Farlow (1958)

Temperature/salinity data were collected using reversing thermometers and bottles. Water samples were sent to Woods Hole Oceanographic Institute, where the salinities were determined using a salinometer (± 0.005 ‰). The samples from station 10 were titrated for salinity.

Station 16 has data on May 15, 1957 in Farlow (1958) and on the NODC system. The actual year is believed to be 1958 and has been included as such.

57-0015 Eldorado

See 56-0014.

58-0001 Burton Island/U.S. Navy O.O. (1963a)

Nansen bottles were used to collect water samples, and salinities were determined by Knudsen titration aboard ship. Protected and unprotected reversing thermometers provide measures of both temperature and depth. The September data are under NODC# 50574 and reported in U.S.N.O.O. (1963a), whereas the August data may have been collected by a different agency since the data were assigned a different NODC#, 50575.

58-0010 U.S. Aircraft Landings/Beal (1968a, p. 334; 1969)

Winter temperature/salinity data were required for use in sea-level studies. Between February and May 1958, 22 stations were occupied off Point Barrow. The pattern was expanded during the winter of 1959 (59-0014) and an additional 22 stations were occupied.

Landings on the ice were made using light planes. Nansen bottles and reversing thermometers were used to collect data. Beal does not discuss the data or results. Station locations were estimated to the nearest 1 minute latitude and 5 minutes longitude from figure 7 of Beal (1968a). It was arbitrarily assumed that the winter stations were occupied in March. The actual number of stations may be more than shown here; Beal indicated 19 stations in 1958, with 22 additional stations in 1959.

58-0011 Ice Island T-3/Atlantic Ocean. Group/Collin (1959)

Atlantic Oceanographic Group personnel took part in the International Geophysical Year Project on Ice Island T-3. 21 oceanographic stations were occupied between May 26 and Sept. 28, 1958. Three or more casts were made at each station. Surface samples were obtained using a bucket, bottle casts used reversing thermometers and salinity was determined by titration.

58-0013 Skate (submarine)/Friedman et al. (1961)

Surface samples were collected from local ice-free areas near the North Pole. The locations and sample depths are provided by Friedman et al. (1961), but not the dates or method of analyses. For the purposes of this report, the sampling has been arbitrarily assumed to have been done during August.

58-?

These 'Sever' series of spring aircraft surveys apparently occur annually; however for many years, including 1958, no references have been located providing further information.

59-0002 Staten Island/U.S. Navy O.O. (1963b)

Nansen bottles were used to collect water samples. Paired reversing thermometers measured temperature while an unprotected thermometer was used to determine depth. Salinities were determined using a conductivity bridge about 3 months later.

59-0014

See 58-0010.

59-0015 Soviet Ice Station NP-8

Sub-ice drift currents were measured using a self-recording BPV-2 current meter designed by Alekseev. The BPV-2 averages current speed over a 3-minute interval; the direction is an instantaneous measurement. Belyakov (1970) presents some of the data as plots of velocity versus depth.

See 56-0013.

59-0016 Ice Floe Charlie I, Alpha II

The data were obtained from Larry Coachman, University of Washington.

60-0001 Burton Island/U.S. Navy O.O. (1964)

Nansen bottles were used, salinity being determined later using a conductivity bridge at the University of Washington. Paired reversing thermometers provided temperature data.

60-0007 PCSP

Temperature and salinity profile data were obtained by means of bottle casts from the sea-ice. Operations took place in a heated tent to avoid freezing of the salinity and oxygen samples. A light aircraft provided transportation between oceanographic stations, located on frozen leads and the base camp at Isachsen. Dr. Melling of IOS tried to locate the BT data (contacted Campbell and Collin); however the data appear to be lost. Collin (1961) also mentioned that four oceanographic stations were occupied in 1959 in addition to those described as part of 60-0007. However, these data are not on file with MEDS nor was any data report or other information located.

60-0013 Staten Island

The data are on file with NODC and MEDS, however no supporting documentation describing methods and accuracies has been found.

60-0014 Ice Station NP-9

The drift of this ice station was primarily west of 180° longitude. However, during the latter time of occupation (1961), the station drifted into the northern portion of the study area and some data may have been collected here. The emphasis of the scientific programs was on oceanography and meteorology (Polar Record, 1961).

60-0015 Arlis I Ice Station/Brayton (1962)

Reversing bottles were used to collect water samples which were sent to Point Barrow for titration. Some bottles broke due to freezing. The only calibration checks done in the field involved comparison of reversing thermometer values against those from the bathythermograph. No salinity values are available for stations 41-50 due to the absence of sample bottles during this period.

Current measurement, using a Japanese-made Ekman-Merz meter, were considered unreliable in direction due to the weak horizontal component of the magnetic field.

The T/S data are plotted in Brayton (1962) and suspect values are flagged. This report, available from the Arctic Institute North America, Montreal, should be referred to before using these data.

60-0016 Canadian Hydrographic Service

The data are on file at MEDS, however no supporting documentation describing methods and accuracies has been found.

60-0019 U.S. Aircraft

This winter survey was a continuation of the program begun in 1958 (see 58-0010 and 59-0014). Beal (1968b, p. 37) discusses techniques for using light aircraft, but no further information regarding the data collected has been found.

61-0024 Staten Island

Hufford (1973) analyzed the data. No actual data report has been uncovered.

61-0025 USSR Ice Station/Bushuyev et al. (1967)

During March and April, 5 ice stations were set up (not including NP-8 and NP-9 which were drifting around the outer fringes of the Beaufort Sea). Apparently, temperature and salinity data was obtained as dynamic topography was used to estimate ocean currents. Drift measurements were also made using a "driftograph" of unspecified operation. A nominal location of 87.5°N, 147°W and the month of April were assigned for this data set.

61-0026 Arlis II Ice Station

This ice station began on May 23, 1961. Oceanographic programs were conducted by University of Washington personnel John Cooper and Phil Church, and John Linhart of the Arctic Research Laboratory (Weeks and Maher, 1965). However, no details or data could be found, even though the University of Washington Oceanographic library was searched. In November 1961, the station drifted west of 180° longitude. Other known positions are: 76°36.8'N, 174°32'W on Oct. 1, 1962 and 76°13.3'N, 178°30'W on Oct. 30, 1962. The station was occupied later on by oceanographers from the University of Washington and Japan (see data sets 64-0013, 64-0014).

61-0027 Hume (1963)

As part of a study on sedimentation "near" Point Barrow, wind, wave, water level and nearshore drift were measured during two periods: July 9-Sept. 5, 1961 and July 27-Aug. 21, 1962.

Waves and water level were measured using a scaled rod driven into the bottom. Nearshore drift was measured using fluorescent dye as a tracer. These environmental measurements were usually made four times daily; morning, noon, evening, and late evening.

62-0021 Northwind/U.S. Coast Guard (1964)

This cruise was primarily conducted in the Bering and Chukchi seas; however, 4 stations (52-55) were located between 156 and 160°W near Point Barrow. Nansen bottles with either two or three reversing thermometers were used and 8 minutes was allowed before tripping the bottles (15 minutes when there was a possibility of ice crystals forming in the bottles). Conductivity was determined using a conductance-type salinometer (model L, University of Washington) with a stated accuracy of ± 0.01 ‰. Copenhagen water was used as the standard. A few samples had anomalously high salinity due to leaking bottles and these data were deleted.

62-0022 Ice Camps/Herlinveaux (1963)

Water samples were collected using Fjarlie Mark III sampling bottles (Fjarlie, 1953). At station 3, the water was freezing in the bottles and salinities are deemed unreliable. Salinities were determined at Nanaimo, using a conductivity salinometer. Ritcher and Wiese reversing thermometers were used and the ice drift was determined by celestial navigation. Also included in the report by Herlinveaux (1963) is the data from station 7 at Ice Island Arlis II (173°E, out of area), collected using Nansen bottles by Mr. G. Brusca of the University of Southern California. These salinities were determined by titration at the Arctic Research Laboratory, Point Barrow.

62-0023 NP-11/Polar Record (1963)

Soviet ice station NP-11 was established in April 1962, roughly 750 km northeast of Ostrov Vrangelya (Wrangel Island). Drift was to the north northeast at about 7.5 km/day. The station was evacuated on Apr. 20, 1963 at 81°08'N, 139°12'W (Smith, 1971). A note in Polar Record (1963) briefly describes the aircraft resupply and relief expeditions conducted as part of the Sever-14 (autumn 1962) and Sever-15 (spring 1963) operations.

62-0024 Ice Island T-3

Observations were made during April-May by U.S. Underwater Sound Laboratory and Lamont Geophysical Laboratory. This was a joint underwater acoustic experiment with Canadian ice camps (data set 62-0022) and personnel on station Arlis II (outside area 7). No details on the measurements made at T-3 are available; Herlinveaux (1963) notes the existence of the data.

62-7 Sever-14

During the spring about 1,000 landings were made on the ice. The usual meteorological, oceanographic, and glaciological measurements were made. Automatic weather stations were also deployed. No further details are available.

63-0012 Ice Island T-3/Hunkins (1967)

Between Aug. 3 and Sept. 21, currents were measured at 100, 200 and 500 m using improved Roberts current meters, manufactured by Marine Advisors Inc. Each meter had been previously calibrated at the Convair towing tank in San Diego. Threshold sensitivities varied between 1.5 and 2.6 cm/s. Unfortunately, the directional data were unreliable, due to the weak magnetic field at this latitude. Some direction information was obtained using a drogue.

Bottom currents were also measured at one location using a bottom tripod-mounted camera to record the motion of a suspended droplet (Hunkins et al. 1969).

63-0013 USSR Ice Station NP-12/Polar Record (1963)

This ice station was established at 76°30'N, 165°W under the leadership of L. Belyakov. Regular reporting began May 1.

Currents were measured using a BPV-2 meter designed by Alekseev. Current speed is averaged over 3 minutes, whereas direction is measured instantaneously (Belyakov, 1970).

63-0014 Sever-15/Polar Record (1963)

These aircraft flights evacuated NP-11 on Apr. 20, 1963. Meteorological, oceanographic and sea ice studies were also made and 23 automatic meteorological stations deployed. In the fall (Oct.-Nov.) 1,000 landings were made on the ice (Polar Record, 1965a). No further details are available.

63-0015 Ice Stations. Defence Research Board of Canada/McGill University

The details of this data set are unknown. Keys et al. (1968, p. 5) mention a station off the Ward Hunt Ice Shelf taken by H. Serson. The location is in the area of the 63-0015 stations, so they are probably one in the same.

63-0016 Arlis II

Operations began at Arlis II in May 1961 (see 61-0026) but in November 1961 the ice station crossed 180°W longitude, out of the area.

In 1963, the ice station crossed back over 180° into this area. It is not known what, if any, data were collected in 1963. The next reported data were in 1964 (see 64-0013).

64-0008 Defence Research Board Canada/Hattersley-Smith and Serson (1966)

This was a motor-toboggan expedition off Nansen Sound. Navigation was by theodolite, fixing stations by bearings on land features. Reversing thermometers and Knudsen bottles were used. Water samples were stored in standard Copenhagen bottles. The method of salinity determination is not provided.

64-0013 Arlis II Ice Station/Tripp and Kusunoki (1967)

Nansen bottles were used to obtain water samples. Two protected reversing thermometers were used on each bottle. For deep casts, an unprotected thermometer was also used. Salinity was determined using an inductive salinometer (model RS-7A, Industrial Instruments Inc., Cedar Grove, New Jersey), which was considered accurate to ± 0.003 ‰, but this value is probably a better estimate of the resolution.

Apparently, University of Hokkaido personnel collected physical oceanographic data at the same time, however titration methods were used to determine salinity (see data set 64-0014).

64-0014 Arlis II Ice Station/Hokkaido University/Kusunoki et al. (1967a)

Scientists from Hokkaido University shared the oceanographic hut with a marine biologist (University of Southern California) and physical oceanographers from the U.S. Naval Oceanographic Office (see data set 64-0013).

Nansen casts were taken daily (exact period of observation unknown), usually using 13 bottles and reversing thermometers (usually 3 per bottle). Some thermometers were found to be off by 0.05°C and were adjusted accordingly. Salinity was determined by Knudsen's titration method (always done twice). These data have not been plotted or listed; however the station locations can be derived from the 64-0013 data.

64-0015 Ice Station NP-13

This station, begun in April 1964, drifted west along the Chukchi slope. No information is available on data or methods.

64-0016 Arlis III

Arlis III was established approximately 275 km northeast of Point Barrow (Fischer, 1968). Hessler (1968) discussed camp operations. No further details on measurements could be found.

64-0017 T-3, McGill/Dunbar and Harding (1968)

Bottles were used to obtain temperature and water samples but the methods were not discussed. Only the start and stop ice island locations are given. They were $80^{\circ}53.5'\text{N}$, $136^{\circ}47'\text{W}$ (June) and $80^{\circ}34.6'\text{N}$, $136^{\circ}50'\text{W}$ (Sept.). The intermediate station locations have been interpolated.

64-0024 Camsell/Meguire et al. (1967)

Three bottles of surface sea water were sampled near sea ice off Barrow during July-August 1964. Chloride (‰) was determined by conductivity meter and by standard seawater. Exact dates and location are not provided.

64-? Sever-16

During March-May, the largest air expedition to date occurred. Twenty automatic weather stations were deployed and 103 oceanographic stations were occupied. No details regarding locations or methods are available at this time.

65-0013 Ice Island T-3/Tripp (1966), Galt (1967)

Tripp (1966) reports both cruises W01 (June 6-Sept. 22, 1965) and W02 (Sept. 30, 1965-Jan. 12, 1966). Since W02 was a continuation of W01 using similar techniques, they are combined as ID 65-0013.

Station locations were obtained using celestial navigation. Nansen bottles were used to obtain water samples and reversing thermometers recorded temperature. For deep casts (over 200 m), unprotected thermometers provided depth estimates. Salinities were determined by Knudsen titration.

Various current meters were used, including:

T.S.K., Ekman-Merz: ± 5 cm/s, $\pm 20^\circ$

Kelvin-Hughes: ± 5 cm/s, $\pm 10^\circ$

National Institute of Oceanography,

Pisa Tube Current Indicator: ± 1 cm/s threshold, $\pm 20^\circ$

No corrections were made for island movement. The Pisa Tubes (Carruthers, 1958) measured currents relative to the bottom.

65-0014 Staten Island, Polar Pack III

The data are on file at the Ocean Information Library at IOS, Sidney, (call no. 120.1 PH31-1965)

65-0016 Fisheries Research Board

See 60-0013.

65-0017 Ice Station NP-14

The only information available for this Soviet drifting station is taken from the Polar Record, which describes the aircraft logistics in deployment and resupply. It was established during the Sever-17 operations in the Chukchi Sea (Polar Record, 1965b). By late 1965, the station had drifted close to Ostrova Delonga (Wrangel Island). By late January 1966, the station was in the region of Ostrov Genrietty; the stations on the ice necessitated a total evacuation which was carried out between 7-12, 1966 (Polar Record, 1967).

65-0022 Arlis IV

Arlis IV was established 140 km northeast of Barrow (Fischer, 1968). As with Arlis III (64-0016) no details on measurements have been found.

65-? Sever-17

No details are presently available regarding this air expedition. A brief mention is made in Polar Record (1965b, 1967).

66-0014 Ice Camp

Oceanographers associated with McGill University occupied 11 stations, four of which are within the bounds of this study area. The program is summarized by Hattersley-Smith and Oliver (1967); however, no details on measurements or methods have been found.

66-0015 Ice Island T-3/Tripp (1967)

Thirty-two casts were made between Jan. 21 and May 21, 1966. Nansen bottles equipped with reversing thermometers were used. Temperatures noted, in most cases, are the average of two values. The depth was calculated from measured wire angles and from smoothed curves of wire length minus thermometric depth versus wire length. Salinity was determined using an inductive salinometer (model RS-7A, Industrial Instruments Inc., Cedar Grove, New Jersey). Accuracy is given as ± 0.003 ‰, but this is actually more indicative of the resolution. Further casts were made between June 11, 1966 and March 25, 1967. These data were not discussed in Tripp (1967).

66-0018 Ice Island T-3

Van Dunk and Mathieu (1969) do not state the methods used for temperature and salinity determinations.

66-0019 Soviet Ice Station NP-15/Vetshteyn et al. (1974)

Operations began April 15, 1966 with the emphasis on oceanographic work (Polar Record, 1967). No locations or times are given. Winter stations were assumed to have been in January; station locations were estimated from figure 1 of Vetshteyn et al. (1974). These stations may have been occupied using aircraft; the atlas of Gorshkov (1983) shows the ice island west of 180° longitude at this time. Perhaps Vetshteyn et al. (1974) plotted the stations at $^\circ$ W longitude, instead of $^\circ$ E.

66-0020 Arctic Research/Lewellen (1972)

Water samples were taken in Esatkuat Lagoon (near Point Barrow) on (1) June 15 and 20, Aug. 1, 1966; (2) May 29, 30, 1967; (3) May 15, 17, 1972. The one salinity in 1967 was determined by titration; in 1972 a Beckman RS-7B salinometer was used. No method is given for the 1966 results. For the purposes of this report, a nominal location of $71^\circ 17.5'N$, $156^\circ 42.0'W$ has been used.

66-? Sever-18

No details are presently available. A brief mention of this air expedition is made in Polar Record (1967, 1969).

67-0010 McGill University/Keys et al. (1968)

Keys et al. (1968) report on the work carried out in Disraeli Fiord (northern Ellesmere Island) during May, June and July 1967. Eight stations were full oceanographic stations using Knudsen bottles; also, 17 other stations were profiled using an in-situ salinothermograph (type unspecified) of limited accuracy.

Current profiles were also made using an Ekman meter and water level observations were also made.

No information on the water level data was provided. For the purposes of this report a nominal location of 83°N, 74°W was assigned and a time frame of June 1967.

67-0012 Ice Island T-3/Hunkins et al. (1969)

Four measurements of bottom currents were made over the Mendeleyev Ridge. A photographic bottom current meter was used which consisted of a camera on a tripod that photographed vane and compass orientation.

67-0013 Defence Research Board of Canada/Hattersley-Smith (1968)

Serson and Finlayson completed 8 oceanographic stations between Cape Aldrich and Nansen Sound along the coastline of northern Ellesmere Island. They have been stored at MEDS as 180767002, the same as the data collected by Keys et al. (1968); however, the report by Keys et al. does not discuss the data collected by Serson and Finlayson.

67-0019 Ice Island T-3

See 56-0014.

67-0020 Ice Island T-3

See 60-0013.

67-0021 Ice Island T-3/McGill

Temperature-salinity data were collected using a thermistor and Wheatstone bridge circuit. This was basically an early, apparently custom-made CTD. No values for accuracy were given (Hansen et al., 1971). Van Dorn bottle casts were also made, with salinity of the water samples determined at Bedford Institute of Oceanography.

67-0024 Ice Island T-3/Kelly (1968)

The study concerned the CO₂ content of seawater. Water was pumped from 5 m beneath the ice where CO₂ content and temperature were determined. The method of temperature determination was not stated.

67-? Sever-19

The air expedition relieved the NP-15 station during April 1967 (Polar Record, 1969). No further information is available at this time.

68-0008 Canadian Hydrographic Service

The actual period of observation is probably not the full two months. These data may be part of the 68-0015 survey.

68-0015 Ice Stations, National Research Council

No supporting documentation has been found. A brief summary of the operation is provided by Hattersley-Smith (1969).

68-0016 Defence Research Board of Canada

Hattersley-Smith (1969) presents only a brief summary of the operation.

68-0018 Ice Island T-3

Bernstein (1972, Figure 10) indicates current profile data collected by Hunkins from ice island T-3. No further information has been found. Further inquiry should be directed to Lamont-Doherty Geophysical Observatory.

68-0019 Ice Island T-3

The agency is unknown, although the leading "31" on the MEDS number indicates the personnel were American. No further details are known.

68-0020 Ice Island T-3

See 68-0019.

68-0021 Ice Station NP-16

In a departure from established Soviet procedure, Alekseev and Buzuev (1973) show temperature, oxygen and silicon profiles from 2 sites. They also provide the locations and dates. They do not provide details on methods or accuracy. Vetshteyn et al. (1974) state that BM-48 sample bottles were used to obtain water samples for oxygen isotope analyses.

68-0023 Northwind/Kinney et al. (1970b)

This ID covers the first "Northwind" cruise in 1968 in the Chukchi Sea area (cruise no. 751). Nansen bottles were used with reversing thermometers and salinity was determined using a Hytech 6220 inductive salinometer at IMS, University of Alaska, Anchorage. Only one of the stations falls within this study area.

68-0031 University of Alaska/Allen (1970)

The study concentrated on ice biota. Ice meltwater was analyzed for salinity, alkalinity, pH and plankton. Water samples from beneath the ice, collected using 3 or 5 litre samplers, were also analyzed, the salinity being determined using an inductive salinometer. The sample depths were not always specified but appear to be obtained at near-surface levels, from directly under the ice, down to depths of 5 m. Sampling was done in Elson Lagoon and off Point Barrow in December 1968 and April, June and August 1969. Exact dates were not specified.

The station latitude/longitudes have been extracted from Figure 1 of Allen (1970).

68-? Staten Island

Burrell et al. (1970) indicate a cruise by the Staten Island; however no results were provided. Burrell was contacted for more detail; however no response has been received. Further enquiries should be directed to him (902-474-7768).

68-? Sever-20

No details are available. The air expedition is mentioned in Polar Record (1969).

69-0021 Ice Station, National Research Council of Canada

No supporting documentation has been found.

69-0022 University of Alaska/Kinney et al. (1971)

D. Schell and P. Kinney used Cessna 180's, from the Naval Arctic Research Laboratory (NARL) at Barrow, to make a September 1969 and a March 1970 survey. Water samples were primarily for nutrient analyses; however salinity was also determined. The method of salinity determination and accuracy were not specified. Station locations have been estimated from a figure in Kinney et al. (1971). Further inquiries should be directed to D. Schell at the University of Alaska, Fairbanks (907-474-7115).

69-0024 Ice Island T-3

An unknown American agency was involved in the collection of these data. No supporting documentation has been found.

69-0025 T-3

The last data on the MEDS file was taken September 26. However, the University of Washington took a Nansen cast in November 1969 (Neshyba et al., 1971). No supporting documentation has been found.

69-0026 University of Alaska/Matthews (1970,1971)

A bubbler pressure gauge recorded hourly at Eluikak Pass beginning late September 1969. The back pressure in the connecting tube is used to measure the hydrostatic pressure. Continuous measurements were made from 1969 to 1970 (Matthews, 1970) and indications are they continued through to 1972.

69-0027 Ice Island T-3/Neal et al. (1969)

A modified XBT was used to obtain detailed temperature profiles in March 1969 (Denner et al., 1971). The resolution of the XBT is stated to be better than 0.002°C.

69-0028 Ice Island T-3, Oregon State University/Neshyba et al. (1971)

A Geodyne CTD probe was modified to cover temperature over a dynamic range of only 4°C and conductivity over a 4 mmho/cm range. Conductivity, temperature and pressure were recorded every 4 seconds. The CTD also carried a Savonius rotor and vane; however, currents were often below the 1 cm/s threshold. Dates of measurements were not reported (Neshyba et al., 1971). University of Washington personnel also made Nansen casts at about this time (Tripp, unpublished).

69-0029 NP-19

Legenkov et al. (1974) discuss temperature measurements begun April 9, 1970. It is not known where the ice station was at this time, or if physical oceanographic data were collected from the station's initial occupation in November 1969 until the temperature measurements commenced in April 1970.

69-? Sever-21

No details are available. The Polar Record (1970) mentions the air expedition as being larger than usual and was called "Sever 69" as well.

70-0001 1st AIDJEX Pilot Study/Coachman and Smith (1971)

The AIDJEX program involved three pilot studies (1970, 1971 and 1972), a lead experiment off Point Barrow in 1974, and the main experiment of 1975-76.

The 1970 pilot study was in cooperation with the Polar Continental Shelf Project and covered the period Mar. 12 - Apr. 5. Its main camp was within a Canadian hydrographic survey camp (Camp 200) located approximately 240 miles north of Tuktoyaktuk. The camp location was initially 72.5°N, 135°W and ended at 72°N, 144°W.

Temperature and salinity data were collected using Nansen bottles and reversing thermometers. Synoptic hydrographic casts were planned to 500 m at three stations spaced in a triangle with sides of approximately 10, 20 and 30 km. One 3-station and nine 2-station synoptic casts were obtained.

Hydrographic Stations

	<u>C-200</u>	<u>Leo</u>	<u>Aquarius</u>
March 24	1330 1630	1430	1330
March 26	1030 1330 1630	1030 1630	
March 27	1030 1330 1630	1030 1330 1630	
March 29	1030 1330 1630	1030 1330 1630	
March 30	1030 1335	1030	

Braincon meters (models 316 Histogram, 381 Histogram and 573 digital) were suspended beneath the ice at depths of 10, 40, 150 and 500 m. The 381 meters experienced clock-drive mechanism failures in water colder than 0°C and the digital meters failed to record direction.

Measurements of boundary-layer currents were obtained using downward-facing masts mounted with three mechanical current meters, developed by J.D. Smith. Masts were deployed at 5 locations down to 17.7 m beneath the ice. Good data were obtained, primarily over a 4 day period during the passage of a storm. The current meter dates and locations we have used are March 12 and the start/stop locations of the ice floe. Dr. H. Melling of IOS has expressed doubts concerning the quality of the data, thus the "1" rating.

70-0021 University of Alaska for Environmental Protection Agency/Kinney et al. (1971), Alexander et al. (1975)

A. May 23-30, 1970

Sampling was done in eastern Harrison Bay and Simpson Lagoon using a snowmachine and sled (May 24-27); offshore and in western Harrison Bay and Kogru Inlet using a Cessna 180 (May 27). Methods of salinity determination were not stipulated, nor were station locations (Figures only).

B. August 8-September 1

23 stations were occupied in Simpson Lagoon and eastern Harrison Bay. Surface drift was measured using drogues and expendable citrus fruit floats (ECFF).

C. December 3-5

Six stations were occupied in Harrison Bay and Simpson Lagoon using snowmobiles.

70-0022 Ice Island T-3/Bernstein (1972)

Current measurements were made using externally recording (Marine Advisors, model Q-9) meters of the Savonius-rotor and vane type. Five instruments, at 2 depths (70 and 40 m) and 3 sites, were used to form a two-tiered triangular array. The meters were suspended beneath the ice and directionally oriented to surface reference. All telemetry cabling were brought to a single site and recorded on 1 tape. Sampling time interval was 1 minute with speeds integrated over a 30-second period. Direction was integrated over 5-second intervals.

At site B, the lone meter at 40 m had a sticky vane, resulting in suspect directions for speeds less than about 10 cm/s. Also, the site C meters appeared slightly more reliable at low speeds than the meters at site A.

Satellite (perhaps Bernstein meant "celestial"?) navigation fixes allowed the drift of the ice island to be computed and added to the current meter velocities. For plotting purposes, we have used a nominal camp location of 85°N, 95°W.

70-0025 National Research Council of Canada

The MEDS number identifies the agency as National Research Council, Halifax. No supporting documentation has been found. The Frozen Sea Research Group was working in Greely Fiord in March-April (see Queen Elizabeth Islands data compilation, ID #70-0017) and the two projects may have been cooperative.

70-0026 Ice Island T-3

Apparently this is part of the project headed by Dr. T.S. English of the University of Washington. From 1970 to 1973, his group made Nansen casts at T-3 (Smith and English, 1973; Morison and Smith, 1981). No further details are presently available.

70-0027 Ice Island T-3

See 70-0026.

70-0028 NP-20

This ice station was established in April 1970, 650 km north of Wrangel Island. The station drifted slowly north and was evacuated at 81°42'N, 166°W in May 1972. Particular emphasis was placed on the study of water masses at depth (Polar Record, 1972).

70-0029 Ice Island T-3/Neal and Neshyba (1973)

A modified expendable bathythermograph (Denner et al., 1971) was used to take repeated vertical temperature profiles. During Dec. 7 - 8, 1970, 40 hours of profiles were obtained. Profiles were also made on March 30, 1971; during Nov. 26 - 27, 1971, 5-minute profiles were obtained over an 80-m depth interval.

70-0036 University of Alaska/Horner (19??)

Ice cores were obtained using a SIPRE corer. Surface water samples were taken from the hole left by the corer and poured into 4 litre plastic bottles. During the ice-free season, water was sampled using Van Dorn-type bottles. Salinity was determined using a Beckman RS7-B induction salinometer. The main sample locations were 1.5 km offshore of the Naval Arctic Research Laboratory, in water 8 m deep; the other was in Eluittkak Pass. The latitude/longitude for these two sites was taken from Figure 1 (Horner, 19??). Samples were also collected off Wainwright, Prudhoe Bay and at three deep water sites.

Some temperature measurements were also made between June 30, 1970 and March 22, 1971.

70-? Sever-22

No details are available. Polar Record (1971) briefly mentions the air expedition.

71-0003 2nd AIDJEX Pilot Study/Hunkins (1972), Newton and Coachman (1973a)

The second AIDJEX pilot study was conducted from Camp 200, operated by the Polar Continental Shelf Project. The interior flow field was studied by personnel from the University of Washington (L.K. Coachman, J.D. Smith and J.L. Newton), and K. Hunkins from Lamont investigated the boundary-layer currents near the water-ice interface.

The University of Washington measurements covered the period from Mar. 16 to Apr. 2, 1971 and consisted of hydrographic casts, current meter measurements, ice motion measurements and weather observations. Nansen casts were made at the main and two secondary camps 4 times per day. Reversing thermometers were used and water samples were sent to Seattle for salinity determination. Five current meter records were obtained between 10 and 400 m depths using Braincon 316 and Aanderaa RCM 4 current meters. The meters were suspended beneath the ice.

The Lamont program involved Savonius-rotor current meters mounted on inverted masts at fixed depths. The fixed meters were at 5, 7, 11 and 19 m on one mast and at 32 and 75 m on the other. Directional reference was through surface orientation. Current profiles were also made by lowering a meter by hand. Temperature profiles were made using a thermistor. Camp location was 74°05'N, 131°23'W on March 18; 73°44'N, 131°08'W on April 7.

71-0013 Louis S. St. Laurent

Temperature/salinity data were collected in August from the Louis S. St. Laurent. Knudsen bottles were used, combined with paired reversing thermometers. Temperatures were believed accurate to 0.02°C and salinities, using a Bissett-Berman salinometer, precise to 0.005‰.

71-0020 Glacier/Hufford et al. (1974)

During Aug. 17 - Sept. 20, 1971 and Aug. 2 - Sept. 12, 1972, the U.S. Coast Guard cutter Glacier and the R/V Natchik were used to do ecological surveys of the Beaufort Sea (WEBSEC 71-72). The Natchik collected temperature and salinity data using Nansen bottle casts, whereas the Glacier was additionally equipped with an STD and made XBT drops and current meter lowerings.

The STD used was a Bissett-Berman model 9006 (in 1971) and model 9040 (in 1972), using reversing thermometers and Nansen and/or Niskin bottles to collect water samples. Conductivities were determined using inductive salinometers calibrated with standard Copenhagen water. Salinities were computed using the International Oceanographic Tables.

In 1971, currents at surface, 20 m and near-bottom were measured while at anchor using Hydroproducts 501 and Geodyne 102 current meters. In 1972, short term current measurements were made using Geodyne 102 meters. As well, Geodyne 102 meters were moored at 25 and 50 m depths for 36 days on the continental shelf just east of Point Barrow (Hufford, 1975). Processing of the data was done by E.G. & G. Company of Waltham, Massachusetts.

Note that Hufford et al. (1974) and NODC have the Glacier data on file but not the data collected by the Natchik in either 1971 (71-0021) or 1972 (72-0028). No dates or locations for these data have yet been found. Hufford et al. (1974) show a plot of the station locations and use the data for plotting, but do not include them in the appendices as they do the Glacier data. USGS personnel were also on this cruise (Barnes et al., 1973). Their data have been assigned ID #71-0040.

71-0021

See 71-0020. Station locations extracted from Figure 2 (Hufford et al., 1974). Nominal date of August was used.

71-0022A University of Alaska/Dygas (1975)

An Aanderaa current meter, sampling every 10 minutes, was moored 1 m off the bottom in water 2.5 m deep. At this shallow depth, errors in speed and direction measurements may have occurred in the presence of surface waves.

Surface drift was also measured using drift cards (Dygas and Burrell, 1975).

71-0022B University of Alaska/Alexander (1974)

As part of the biological program, salinities were also measured (method unknown). Station locations were extracted from Figures 5 and 8 (Alexander, 1974).

71-0023 Northwind/Paquette and Bourke (1973)

This cruise was primarily dedicated to tending 2 drifting ice floe stations, but it was also used to obtain temperature and salinity data. A Bissett-Berman 9006 STD was used, but initially had a lower salinity limit of

30°/oo; therefore near-surface data were obtained using a hand-lowered Beckman RS5. Stations 105 to 163 were made with the 9006 STD using a shunt to lower the salinity scale. Different response times of the sensors produced poor data, in gradient zones, which were smoothed manually.

The RS5 and 9006 results were compared and mean differences were 0.29°C and 0.41°/oo. Corrections were applied to the RS5 data, however, they remain suspect. The 9006 STD was calibrated against water samples collected just above the instrument. Salinity error averaged 0.09°/oo with a standard deviation of the mean of 0.01°/oo. Temperature error was -0.07 and 0.007°C deviation. Corrections were made for the mean errors.

Data were digitized from the paper records and sigma-t computed using Knudsen's formula.

71-0024 Applied Physics Lab., University of Washington/Garrison and Pence (1973)

In conjunction with the temperature-salinity program, current meters were suspended beneath a drifting ice floe. A nominal location of 71°30'N, 155°W has been used.

71-0025 University of Alaska/Schell (1975)

See 69-0022. Station locations have been extracted from Figure 10 (Schell, 1975). Nominal date of May has been assumed.

71-0026 University of Alaska/Schell (1975)

A tractor-train operated by the Naval Arctic Research Laboratory followed the coastline between Point Barrow and Harrison Bay. See 72-0033 for methods. Station locations have been extracted from Figure 3 of Schell (1975) and are considered accurate to ± 1 minute latitude, ± 1 minute longitude. All stations of the April - May survey have been arbitrarily assigned a date of April 1971.

71-0031 Ice Island T-3/University of Washington

See 70-0026.

71-0032 Ice Island T-3/University of Washington

See 70-0026.

71-0033 Colville River Delta/Walker (1974), Hamilton et al., (1974)

Usually a helicopter was used to land on ice at the station location. A portable Beckman RS5 was used to measure temperature and conductivity at 60-cm intervals (15 cm near the pycnocline). A thermistor was also used to measure temperature to 0.1°C at the same intervals. Water samples were collected near the interface for chemical and sediment analyses. The report does not provide station locations, times or depths. The station locations have been extracted from a figure of Walker's to the nearest 1 minute. In January 1984, Walker (LSU) was in the process of producing a more complete assemblage of the data for the North Slope Borough.

71-0034 Ice Island T-3/University of Washington

Morison and Smith (1981) present data collected during the first half of 1971. No primary references for these data have been found. Further inquiries should be directed to Mr. R. Tripp, University of Washington.

71-0035 University of Alaska/Horner et al. (1974)

Water samples were collected with 6 litre polyvinyl-chloride bottles. Station locations have been extracted from Figures 1-3 of Horner et al. (1974). Only the range of dates for each survey were provided; therefore, in most cases, exact dates have not been listed. On the third cruise, a Beckman RS5-3 probe was used to measure temperature and conductivity.

71-0036 Canadian Hydrographic Service

MEDS records show the start date as day one of the month of deployment, and stop date as the last day of the month in which the instrument was recovered. The actual period of deployment is generally only about one month long, not the two months suggested by their records.

71-0040 U.S. Geological Survey/Barnes et al. (1973)

USGS personnel conducted surveys along the Alaskan Shelf using the Natchik (71 AJT-USGS ref. no.), Loon (71 AER) and Glacier (71 ABP). Although they were working on the Natchik at the same time as Hufford et al. (1974), ID #71-0021, different programs, methods, etc. were involved.

71-0044 University of Alaska

See 70-0036.

71-? Sever-23

No details are available. The air expedition is mentioned in Polar Record (1972).

72-0027 U.S.C.G.C. Glacier, Websec-72

See 71-0020.

72-0028 R.V. Natchik, Websec-72

See 71-0020. Station locations were extracted from Hufford et al. (1974), Figure 3. The nominal date of August was used in the listing.

72-0029A University of Alaska/Dygas (1975)

An Aanderaa current meter was moored in the same location as in 1971 (1 m off the bottom in 2.5 m of water) and recorded every 10 minutes.

Surface drift was also measured using drift cards.

72-0029B University of Alaska/Schell (1975), Alexander et al. (1975)

Water samples were collected using 2-litre plastic Van Dorn bottles. Errors in salinity may have occurred due to ice formation in the bottles during rinsing. Most salinities were determined using a Beckman model RS-7B salinometer. In-situ measurements were also made using a Beckman RS-5 salinometer.

Station locations have been extracted from Figure 9 of Alexander (1975) and are accurate to only about +1 minute.

72-0030 Ice Camp/Garrison et al. (1973)

Only 1 cast/day on the ice camp is listed here; however 10 to 15 casts/day were actually made. Station locations were extracted from Figure 12. Two stations at 71°N, 157°W plot on land and were changed to 71°32'N, 157°30'W.

72-0031 Louisiana State University/Wiseman et al. (1973)

Occasional STD data were collected in Simpson Lagoon, near Pingok Island, and drogues were tracked. No details regarding station locations and measurements are provided.

72-0032 U.S. Geological Survey/Barnes and Garlow (1975)

4200 drift cards (cards encased in plastic envelopes) were released during the August - September 1972 WEBSEC cruise. Return rate was 1.8%.

The spring runoff of the Kuparuk River into Gwydyr Bay was also studied in June. Velocities and the depth of the fresh/seawater interface are mentioned by Barnes and Reimnitz (1972); however, no further information on measurement techniques was provided. Barnes and Reimnitz (1973b) mention temperature/salinity data for July 1972 and August-September of 1970, 1971 and 1972; however no details are provided. In 1972, three cruise segments were involved: Natchik (72AJT), Loon (72AER), and Glacier (72APB). The program was apparently independent of simultaneous studies by Hufford et al. (1974) aboard the Natchik (72-0028).

72-0033 Ice Island T-3

No primary reference has been found, although Morison and Smith (1981) present temperature/salinity results for this year.

72-0034 University of Alaska/Kogl and Schell (1975)

During fishing research, temperature and salinities were also measured in the Colville River delta. No details of methods are given.

72-0035 AIDJEX '72 Pilot Study

A. Lamont-Doherty Geological Observation Group/Hunkins and Amos (1972)

Lamont-Doherty Geological Observatory conducted a program to determine the water drag on the bottom of ice floes. 10 Savonius-rotor current meters (Bendex/Marine Advisor Q-9) were mounted on 3 inverted masts beneath the ice. Current direction was referenced to the floe, the orientation of which was monitored celestially. Current profiles were also obtained using current meters and a specially designed "ocean boundary profiler" (Hunkins, 1973). Also, 2 Geodyne 850 current meters were moored at 250- and 345-m depths.

A Bissett-Berman 9040 STD was used to measure temperature, conductivity and pressure. The STD salinity output tended to drift when the instrument was held stationary in the water column. The reason for this could not be determined; however, Nansen bottles were used to collect samples for calibration.

B. University of Washington Group/Newton and Coachman (1973b)

The University of Washington group, as in 1970 and 1971, measured currents and water properties in order to determine how accurately Arctic Ocean currents could be estimated using the traditional geostrophic methods. Recording current meters were installed (presumably suspended beneath the ice) and hydrographic casts were made at each of the 3 stations. Aanderaa RCM4 and Braincon 316 current meters were used. Current meter malfunctioning caused the loss of directional data at 500 and 850 m at BM camp and of all data below 30 m at JS camp. The hydrographic casts employed Nansen bottles and reversing thermometers. For our purposes, we assume current meter locations to be nominal camp locations of 76°N, 150°30'W; 75°15'N, 153°30'W; and 75°N, 149°30'W.

C. University of Washington/Smith (1972)

J.D. Smith (1972), of the University of Washington, was in charge of a surface boundary layer study. Triplets of component measuring current meters were fixed at 1, 2, 4, 8, 16 and 26 m below the ice bottom on two short frames; at 2, 4, 8, 12, 16, 20, and 26 m on a third short frame; and at 26, 32, 38, 44 and 54 m below the ice on a long mast. CTD data were also collected between Mar. 13 and Apr. 26, with 297 lowerings to 65 m and 20 lowerings to 1000 m respectively.

D. McGill University/Pounder and Langleben (1972)

This group collected 10 temperature and salinity profiles from Apr. 6 - 12. A malfunction caused a salinity offset of about 0.5°/oo. The instrument used was not specified.

E. University of California/Goddard (1972)

One of this group's projects included measurements of water speed every 5 minutes at 12.5, 25, 50, 100 and 200 cm from Mar. 27 to Apr. 14. No details of instrumentation/methods were given.

F. University of Alaska/Horner (1972)

Divers, while conducting ice-bottom biota studies on April 23, 1972, collected a water sample using a hand held Van Dorn-type water sampler. The salinity was determined to be 30.15⁰/oo.

72-0038 National Research Council of Canada

No references have been found. The data are stored at MEDS under an identifier which indicates the agency was NRC, Halifax.

72-0039 National Research Council of Canada

As per 72-0038. Sadler et al. made measurements further south in Robeson Channel during April-June (see Baffin Bay data report, ID #72-0018, Sadler (1976)) but there is no indication they made the measurement further north in July. Also, different MEDS numbers are involved; therefore it apparently was not Sadler's group that made the measurement in the Lincoln Sea.

72-0041 Burton Island, MIZPAC '72

See 71-0023 for methods.

72-? Sever-24

No details are available. Polar Record (1972) mentions the air expedition.

73-0026 Burton Island

A CTD developed by the University of Washington was used and checked with results from Nansen bottle casts. The salinity profiles appeared to be high by about 0.1⁰/oo, increasing to 0.2⁰/co. Resolution was believed to be ± 0.05 ⁰/oo.

73-0027 University of Washington/Mountain et al. (1976)

One array, with Aanderaa current meters at 96 and 126 m, was moored in Barrow Canyon from Apr. 18 to Aug. 17. Sampling was every 20 minutes and included temperature. Two records 120 days long were acquired. Estimated accuracies were given as ± 1 cm/s, ± 3 degrees direction and $\pm 0.2^{\circ}\text{C}$.

73-0028 University of Alaska/Schell (1975)

See 72-0029B for methods.

Station locations have been extracted from Figures 8 and 9 of Schell (1975) and are accurate to about ± 1 minute.

73-0033 USSR Aircraft Survey

These high-latitude air expeditions had by now become complex operations. In 1973 (Sever-25), 1974 (Sever-26) and 1975 (Sever-27), the expeditions lasted about three months in the spring and a shorter period in the fall.

From 1973 to 1975, about 180 stations were occupied as part of the Soviet Polar Experiment (POLEX). The locations of these stations are unknown to the authors. POLEX extended through to 1980 and the Sever series continued to occupy stations in support of the experiment.

73-0034 Soviet Ice Station NP-22/Mel'nikov (1976)

This station was established in September 1973 at 76°14'N, 168°31'W on an ice island estimated to be 400 years old. By 1976 it was in the Beaufort Gyre. In September 1977 the ice station had been manned for 4 years, the longest station occupation to date.

From May to November 1975, specific studies of biological productivity were made. The first station was at 83°54'N, 167°58'W on May 20, 1975 and the last at 83°17'N, 154°35'W on Oct. 19, 1975. In all, 8 bottle stations and 10 plankton stations were occupied. Bottle samples were made using an 8-litre plastic bottle with samples at 5, 25, 50, 100, 200, 300, 500, 1000 and 30-50 m from bottom.

Sampling continued during Apr. 12 - May 1976 (Mel'nikov, 1977). This program included a 12-hour series of temperature measurements at 20 m intervals to a depth of 220 m to observe internal waves.

Further sampling was done in May - October 1977 and during April 1978.

73-0035 Ice Island T-3

See 72-0033. As well as the University of Washington program, W. Reeburgh of the University of Alaska made a cast to 1300 m. These latter data have been reported by Ostlund (1982).

73-0037 U.S. Geological Survey

Current data 2 m off the bottom were obtained using a Geodyne meter. The location was northwest of Thetis Island and covered the period June through mid August. The data have not been published. Barnes, of the USGS, told us that the data may be seen at Menlo Park, California. Temperature/salinity may also have been collected (Barnes and Reimnitz, 1973c).

73-0038 Louisiana State University

See 71-0033.

73-0045 Jet Propulsion Lab/Atlas (1973)

Surface samples were collected in flasks and bottom samples via a Van Dorn sampler. Temperature and salinity were determined using a Beckman portable salinometer (Model RS-5). Salinities of the samples were checked with a lab model RS-7a inductive salinometer.

74-0037 APL-University of Washington Ice Stations

Station locations were not given. They have been estimated from the ice floe trajectory on Figure 27 (Garrison and Becker, 1975). Two CTD units were used. The first consisted of a thermistor and NUS conductivity cell, whereas

the second used a newly-developed conductivity cell. Intercalibrations, including Nansen casts, showed the NUS cell to be reading about $0.4^{\circ}/\text{oo}$ too high. Most profiles were made with this instrument.

74-0038 APL-University of Washington

The instrument used was not specified (Garrison and Becker, 1975). It agreed well with the results from other instruments on board. It was probably the APL-developed CTD used in 73-0026 and 74-0039.

74-0046 AIDJEX Lead Experiment

A. University of Washington/J.D. Smith (1974a)

Profiles of conductivity and temperature were made using an unspecified CTD. Calibration of the CTD was checked by comparing the measured temperature profiles in the mixed layer with freezing temperature profiles calculated for this region using the equation of Fujino et al. (1974). The estimated accuracies were given as 0.001°C and $0.02^{\circ}/\text{oo}$.

Current measurements were obtained using current meters attached to inverted masts, and current profiles.

No details regarding times, etc. were available.

74-0047 Sever-26

See 73-0033.

74-0048 Staten Island

These data are filed at both MEDS and NODC, but no primary reference has yet been found.

75-0005 AIDJEX Main Experiment

A. CTD Data/Bauer et al. (1980a, b, c, and d)

At four ice camps, 1391 CTD casts were made during the main AIDJEX experiment from April 1975 to April 1976. Casts were made at least once a day from 0 to 750 m at all camps and weekly casts to 3000 m were made at the main camp. Severe ice activity caused abandonment of the main camp (Big Bear) during October 1975. Between casts, time series were recorded at fixed depths in the pycnocline; these data are still being processed (Manley, personal communication).

Plessey 9040 STD's were used, except at the Caribou camp, where the STD sensor was replaced by a CTD 9040 sensor in January 1976. The data were corrected for the different response times of the temperature and conductivity sensors, by varying a lag correction until one value gave nearly congruent traces for descending and ascending casts.

A salinity drift occurred when the STD was stopped for bottle samples. This was corrected in an unspecified manner. Static calibration was provided by bottle samples and reversing thermometers. At the satellite camps,

generally 2 bottles were taken with each cast. At the main camp, a rosette sampler allowed up to 10 bottles per station; the average being 4. Salinities were determined at the main camp using a Guildline Autosol salinometer, except over the summer of 1975 when a backup Hytech salinometer was used. Differences between bottle data and CTD were typically ± 0.001 to $\pm 0.047^\circ/\text{oo}$ and ± 0.024 to $\pm 0.044^\circ\text{C}$.

The data were simultaneously recorded on analog chart recorders. In 67% of the profiles, the digital data logger failed to function properly and the analog traces were manually digitized to provide temperature and conductivity data. Accuracy using this method was typically ± 0.025 to $\pm 0.050^\circ/\text{oo}$ and ± 0.037 to $\pm 0.059^\circ\text{C}$. The station headers are provided in Section 11.4.

B. Current Profiles/Manley et al. (1980)

Profiles of relative current speed and direction were recorded about twice daily between surface and 200 m at each of the 4 camps. In total, 2084 current profiles were made and 1174 were useable. Current time series were also recorded - 9 at camp Caribou, 2 at Blue Fox, 17 at Snowbird and 28 at camp Big Bear. The instrument used was a Tsurumi-Seiki Co. Ltd. (TSK) unit with a Savonius rotor, directional vane and pressure sensor. Direction was referenced to an internal magnetic compass; internal friction on the directional system was minimized. This was considered important because of the weak horizontal component of the earth's magnetic field. Analog charts were manually digitized to provide as much detail as possible. Absolute velocities were determined by vector addition of the ice velocity based on the precise satellite navigation.

The Savonius rotors were sluggish, probably due to bearing drag. In order to calibrate them, they were compared with the more accurate readings of the 30 m fixed-mast velocity sensors. These station headers are listed in Section 11.5.

C. Fixed Current Meters

Fixed-mast current meters were suspended beneath the ice at each camp at depths of 2 and 30 m below the base of the ice. The instruments were HydroProducts with Savonius rotors. The direction sensors were referenced to the instrument case, which was referenced to the camp azimuth and therefore, true north. The data was recorded at 30-second intervals on the data logger as well as on a multipoint recorder. No data reports are yet available for this data, but hourly-averaged values can be obtained from NODC.

75-0052 University of Washington/Helicopter/Aagaard (1976)

Lines of CTD stations were occupied across the Beaufort Sea Shelf. This is probably the first time a helicopter and portable CTD system were used to do a synoptic oceanographic survey. A Nansen bottle and reversing thermometers were deployed with each profile. The collected salinity samples were frozen and analyzed with an inductive salinometer upon return to Barrow.

75-0053 Ice Camp, Applied Physics Laboratory, University of Washington

Local times are given; positions are extracted from Figure 1 (Garrison, 1976). Only 1 cast/day is indicated here, although up to 6 casts were actually made per day. Garrison does not discuss instrument performance or accuracy.

75-0054 Aircraft, Applied Physics Laboratory, University of Washington

Times are local. Positions were extracted from Figure 5 (Garrison, 1976). Accuracies were not specified.

75-0055 Aircraft, Applied Physics Laboratory, University of Washington

Times are local. Positions were extracted from Figure 7 (Garrison, 1976). Accuracies were not specified.

75-0056 Helicopter, Applied Physics Laboratory, University of Washington

Times are local. Positions were extracted from Figure 33 (Garrison, 1976). Accuracies were not specified.

75-0057 Karluk, U.S. Geological Survey/Barnes et al. (1977)

Surface temperature and salinity observations were made using a conductivity cell. Accuracies were given as $\pm 0.5^\circ$ and $\pm 0.5^\circ/\text{oo}$. No station locations or dates are provided and the data have not been plotted or listed.

75-0058 Environmental Protection Agency/Callaway and Koblinsky (1976)

Instruments were to be deployed offshore of Prudhoe Bay; however bad ice conditions caused the field work to be aborted.

Water level measurements were obtained at Stockton and Thetis islands. Two Bass Engineering optical lever tide recorders were installed. The recorders were mounted on tripods, fitted with a 50 pound (22.7 kg) weight and lowered by rope to the bottom. A vinyl buoy was used as a marker. Precision/accuracy of the measurements was not specified by Callaway and Koblinsky (1976), possibly because the data analysis was still in progress.

75-0059 Alaska Department of Fish and Game/Bendock (1977)

While doing fishery research, temperature/salinity data were collected using a Yellow Springs Instrument Co. meter. The data were put into OCSEAP format and stored on magnetic tape. Seventy-six stations were sampled in both 1975 and 1976. They are in the NODC files under F123/TR0642. We have assumed that temperature/salinity data were collected at all the locations on file. Some locations plot on land; they are the locations received from NODC.

75-0066 MIZPAC '75

The pertinent reference has not yet been obtained (Zuberbuhler and Roeder, 1976). This study may have been outside our study area.

75-0067 Ice Station NP-23

Very little information could be located for this drifting ice station. The station was established on an ice island (over 20 m thickness) in December 1975 (Polar Record, 1977). This station along with NP-22 was used exclusively in both 1975 and 1976 as a base for the Pollex North Program. Polar Record (1978) notes that NP-23 was by October 1977 only 200 km from the North Pole. The work program, at least at that time, included sea ice studies, diver-based biological studies, investigations of micro-organisms near the ice-water interface, and fisheries.

75-0068 Oceanographic Services Inc. for AMOCO et al./OSI (1976)

This was a winter ice movement study, however water-level and current information were collected. No further details are available. OSI and the 8 oil companies who funded the project have been approached for more information. Of the eight oil companies, Mobil (contact Bill Mitchell 214-658-4856), Chevron (contact Larry Brooks 213-694-7656) and AMOCO (contact Bob Nagel 303-830-4218) have yet to respond to the request for release of the information.

75-0072 OCSEAP**A. University of Louisville/Atlas (1975)**

Samples were collected during August-September between Barrow and Prudhoe Bay for microbiological studies. A Boston Whaler and the USGS Beaver aircraft were used. Surface water samples were collected using Niskin bottles. Nutrient analyses were done by Dr. Vera Alexander. Temperature/salinity was determined using a Yellow Springs Instrument (YSI) meter. The paper by Atlas (1975) gives location (eg: Barrow) but no latitude/longitude, therefore, the coordinates used are nominal.

B. Oregon State University/Morita and Griffiths (1975)

In conjunction with Atlas' group, further sampling was done by Oregon State personnel. Locations, times, etc. were similar to 75-0072A and have not been plotted.

75-? Sever-27

See 73-0033.

76-0037 Helicopter, University of Washington.

See 75-0052.

76-0038 Helicopter, University of Washington/Aagaard (1981a)

Two current meter moorings were suspended from fast ice near Narwhal Island (NAR-1, NAR-2) at a depth of 10 m. The ice moved during the last 6 days of the NAR-2 record; however radar tracking of the site allowed University of Washington personnel to subtract the ice motion from the current meter record.

76-0039 University of Washington

The instrumentation for T/S data collection was not specified.

76-0041 University of Alaska, U.S.G.S.

Accuracies were not stated.

76-0042 U.S.C.G.C. Glacier, Helicopters

Richardson expendable surface current probes (ESCP) were deployed by helicopter. Upon reaching bottom, the probes release two floats with about a 3-minute delay between releases. The separation of the floats when they reach the surface is then related to the vertically-averaged current. Relative float positioning was estimated to be ± 2 m, which suggests speed accuracies of about ± 1 cm/s.

76-0043 Helicopter, Applied Physics Laboratory, University of Washington

Times are local. Station locations were extracted from Figure 8 (Garrison, 1977). Temperature accuracy was not stated.

76-0044 Helicopter, Applied Physics Laboratory, University of Washington

Times are local. Station locations were extracted from Figure 20 (Garrison, 1977). Temperature accuracy was not stated.

76-0045 Alaska Department of Fish and Game/Bendock (1977)

See 75-0059, F123/TR2380.

76-0046 Alaska Fish & Game/Bendock (1977)

One station was occupied at the west dock of Prudhoe Bay. The remaining winter sampling stations were on the Kuparuk and Sagavanirktok rivers and have not been compiled.

76-0051 Small Boat/Wiseman (1979)

Three surveys were made; Aug. 12, 22 and Sept. 6. Each survey consisted of 9 or 10 stations using an Inter Ocean CSTD. No details of station locations, times and depths are given in the paper. A set of drogue tracks was also collected (Wiseman, pers. comm.).

76-0053 Canadian Hydrographic Service

See 71-0036.

76-0054 Oceanographic Services Inc. for AMOCO et al./OSI (1978)

This is a continuation of the 1975 - 1976 study. See the comments under 75-0068.

76-0055 NOAA (1979)

Water level data have been collected at Prudhoe Bay since 1976. The exact dates and locations are unclear. Apparently the 1976 location was dock no. 1 and for 1977-79, dock no. 2. We have assumed dock no. 1 is the old east dock and dock no. 2 the new west dock.

The National Ocean Service index of tide stations NOS (1984) indicates station #9497649 to be continuing from 1976, therefore apparently the record does not end in 1979. The report (NOS, 1984) indicates one location (70°23.3'N, 148°30.1'W) with operation periods of 7/24/1977 - 10/7/1980, 7/9/1981 - 9/25/1981, 7/8/1982 - 9/17/1982 and 7/9/1983 - 9/30/1983.

76-0058 CRREL/Iskandar et al. (1978)

The conductivity of water under the ice was determined at three sites during March-May 1976. Locations were extracted from Figure 1 of Iskandar et al. (1978). Exact sample dates and methods are unknown. A nominal date of April has been used for the purposes of this report.

76-? Sever-28

No details are available. Polar Record (1977) mentions the aircraft survey, but locations etc. are unknown.

77-0044 University of Washington, Helicopter

CTD casts were obtained using a Plessey Model 9400 profiling system, with the sensor package redesigned to fit through a 20-cm (8 inch) hole. A Nansen bottle and reversing thermometers were mounted 1 m above the sensors to allow for field calibration. Salinity of the samples was determined at Point Barrow using a Hytech Model 6220 portable salinometer S/N 49.17 (Tripp, 1977).

This was University of Washington cruise No. W27.

77-0046 Applied Physics Laboratory, University of Washington

Times are local. Station locations were extracted from Figure 4 (Garrison, Welch and Shaw, 1979). Accuracies were not stated.

77-0047 Applied Physics Laboratory, University of Washington

Times are local. Station locations were extracted from Figure 11 (Garrison, Welch and Shaw, 1979). Accuracies were not stated.

77-0048 Applied Physics Laboratory, University of Washington

Times are local. Station locations were extracted from Figure 18 (Garrison, Welch and Shaw, 1979). Accuracies were not stated.

77-0049 Burton Island - MIZPAC 77/Graham (1978)

CTD casts were made using a portable hand-lowered CTD developed by APL-University of Washington (Pederson, 1973). Eighteen stations were occupied by lowering the CTD from a hovering helicopter. Standardization was accomplished

by taking Nansen casts 2 to 5 m above the bottom. The mean difference between the CTD and the bottle salinities was $0.021^{\circ}/\text{oo}$ with a standard deviation of ± 0.025 . The standard deviation of the difference between the CTD temperature and the reversing thermometers was $\pm 0.036^{\circ}\text{C}$.

77-0050 Ice Camp APLIS

Times are local. Station locations were extracted from Figure 21 (Garrison, Welch and Shaw, 1979). Accuracies were not stated.

77-0051 Texas A & M University/Mungall et al. (1978)

A Beckman RS5-3 (modified to measure down to -2°C) was used. It was "considered" accurate to $0.1^{\circ}/\text{oo}$ and 0.1°C . Measurements were taken from a small boat and on Aug. 15, a helicopter survey was done (single measurements at 1 foot depth).

Some current measurements were obtained using a Hydroproducts deck readout current meter with a Savonius rotor. Direction readings are suspect.

Exact measurement locations were not provided and have been estimated from the comments in the text and from Figure 4 of Mungall et al. (1978).

77-0052 University of Alaska/Matthews (1978)

Three Aanderaa current meters were deployed near the bottom using rigid pipe frameworks; 2 were recovered. An in-situ tide gauge was also moored using a similar frame.

Temperature/salinity profiles were attempted using an RS5; however only temperatures were obtained. Nansen bottle casts were also made at 5 sites. Times are local ADT. Station locations were extracted from Figure 1 (Matthews, 1978).

Current profiles were obtained using a Hydroproducts meter (Savonius rotor).

Surface drifters (Woodhead concave plastic discs) were released on Aug. 7. Recovery was 12% for those released inside the lagoons and 2% for those offshore of the barrier islands (Matthews, 1981a).

Accuracies were not stated.

77-0053

Longshore current velocity was measured by timing the drift of a neutrally buoyant float along a pre-determined distance of beach. Other measurements included wave height, direction, period and wind speed and direction.

77-0054 Alaska Department of Fish and Game

See 76-0045, F123/TR8215. Some stations plot on land; these are the locations supplied by NODC.

77-0055 U.S. Geological Survey

Bottom drifters were released in Harrison Bay and recovered through 1978. See Figure 6 of Matthews (1981a) and Barnes and Toimil (1979).

77-0056 Hufford

A surface current study of Harrison Bay was done during August 14-15. The method is unknown, probably expendable probes as used in 1976 (76-0042).

77-0063 University of Alaska

This was a biological survey, although some temperature/salinity data were collected (Schell, personal communication). We have assumed temperature/salinity data were collected at all the primary productivity stations.

77-? Sever-29

No details are available. Polar Record (1978) mentions the aircraft survey. As part of the POLEX program, 162 oceanographic stations were occupied between Greenland and Bering Strait.

78-0032 University of Washington/Helicopter

The current meter moorings were designed and built by the Department of Oceanography, University of Washington (Darnall, 1978). Aanderaa RCM-4 current meters were used.

78-0033 University of Alaska/Matthews (1979)

Helicopters were used for deploying and recovering current-meter moorings during open-water; divers were used for through-ice recovery. Aanderaa current meters were used, mounted with tide gauges on shallow-water instrument frames. The first deployment was through ice in Egg Island Channel. A current meter and tide gauge recorded from May 13 - 26, 1978. Instruments were exchanged on May 26 and again on July 26. In August, current meters and a water level gauge were moored off Beechey and Milne points.

On July 27, both surface and bottom drifters (plastic Woodhead drifters) were released near Beechey Point (Matthews, 1981a). Temperature/salinity data are discussed by Matthews (1979); however it is not clear whether these data were from the current meters or using bottle/CTD.

78-0034 Kinnetic Labs, Texas A&M/Mungall et al. (1979)

A float plane was used to do a hydrographic survey of Simpson Lagoon on July 28, 1978. A second survey was made on Aug. 5, using a helicopter. Mungall et al. (1979) do not state what instrument was used (a Beckman RS5-3 had been used in the 1977 field program). Other temperature/salinity data were collected at Milne Point and near the camp.

A current meter and wave gauge were installed 50 meters offshore with data transferred to shore via a land line. The current sensor was electromagnetic (Marsh McBirney model 512). Time constants of response time

were 0.1 and 20 seconds. The current sensor was placed on a pipe frame, "usually" 20 cm above bottom.

The wave gauge was of the capacitance type, made to order by Specialized Ocean Instruments of Baton Rouge, Louisiana.

Typically, the current and wave sensors were sampled at 0.2-second intervals for periods of 102.2 seconds, then analyzed on a microcomputer.

Drogued drifters were also tracked using direction-finder units. The depth of the drogues was 10 m for offshore and 1 m for drogues released within the lagoon.

Station locations are not specified, but have been estimated from Figures 26 and 27 in the report by Mungall et al. (1978).

78-0035 Woodward-Clyde

Few details are known regarding this data set. The results are reviewed in Mangarella et al. (1982), but the primary references have not yet been obtained.

78-0036 University of Alaska/Matthews (1981b)

Current meters were deployed over the November 1978 - February/March 1979 period. Aanderaa RCM-4's were used, equipped with temperature and conductivity sensors. The instruments were located in March and divers were used to replace them.

78-0042 Soviet Ice Station NP-24

This ice island was initially occupied during the spring of 1978. Polar Record (1978) gives the start location as 330 km NE of Wrangel Island; however the atlas (Gorshkov, 1983) shows a start point west of 180° longitude. Areas of data collection and the location of the ice station after 1979 are unknown.

78-0043 Glacier - MIZPAC 78/Paquette and Bourke (1979), Small (1979)

As in 77-0049, the University of Washington portable CTD was used, both from the ship and by helicopter. Station positioning was mostly using the Omega system, accurate to +5 km. 2 CTD's were used, checked with bottle samples from just above the bottom.

78-0044 U.S. Navy/Ostlund (1982)

These data were collected by the U.S. nuclear submarine U.S.S. Pintado. Dr. Ostlund supplied 1-litre sample bottles and the Navy personnel collected the water samples. Analyses for salinity and tritium (no temperature) were made at the Rosenstiel School of Marine and Atmospheric Science, Miami. Salinity accuracy is estimated to be $\pm 0.02^{\circ}/\text{oo}$. The method of analysis is not stated.

78-0045 Oceanographic Services Inc. for Gulf/OSI (1979)

Measurement sites were selected to complement data collected by the University of Alaska (78-0033). The ice was bad that year and the measurement sites and data recovery differed significantly from the proposal. No further details are available. OSI and the funding oil companies (eight) have been approached for more information. Of the eight, Mobil (contact Bill Mitchell 214-658-4856) and Getty Oil (contact Ed Lilly 713-668-8400) have yet to respond to our request for release of the information.

78-0046 Alaska Department of Fish and Game

These data are on the NODC files, in the F123 bin. The agency is unspecified. Since Bendock was the primary fisheries investigator in this area, we suspect it was he that collected these data. It is not certain that temperature/salinity data were collected at each of the stations on file.

78-0047 University of Alaska

See 77-0063.

78-0059 University of Alaska?, OCSEAP

This was probably a cooperative program with Matthews' group (78-0036). Biology-oriented sampling was done for 3- to 4-day periods in Nov. 1978, and Feb., Mar. and May 1979 in Stefansson Sound; and during April through June 1980 just off Narwhal Island (80-0054). No primary reference has been found. The results are discussed in Horner and Schrader (1982).

The method of salinity determination is not stated. (For 80-0054 a salinity bridge was used.) Apparently for the 78-0059 data set, salinities were determined during May 15-20, 1979 only. For 80-0054, salinities were determined during Apr. 10-June 11, 1980. Samples were from near the bottom of the ice and from near the sea floor.

78-? Sever-30

No details are available. The air expedition is mentioned in Polar Record (1978, 1979).

79-0002 U.S. Coast Guard and CANMAR/Murphy et al. (1981, 1983)

Seven satellite-tracked drifters were released in open water north of the Tuktoyaktuk Peninsula. Five of the buoys moved west across 141°W longitude.

The drifters were designed and constructed at Scripps Institute of Oceanography and did not have drogues. Tracking was done using the RAMS system on board the NIMBUS 6 satellite. Advertized position accuracy was +5 km. On average, one good fix was obtained every 1.4 days.

79-0041 Prudhoe Bay Unit/Woodward-Clyde/Mangarella et al. (1979)

Seven ice stations were established 1-4 km off the west dock at Prudhoe Bay. Positions using a mini-ranger were estimated as being accurate to +3 m. Data were gathered at each station during 3 periods (Feb. 20-25, Mar. 19-24

and Apr. 23-30, 1979). Profiles of current, conductivity, temperature, dissolved oxygen and transmissivity were measured at each station. Also, recording current meters were moored at each of stations 2 through 7.

The moored current meters were Endeco 105 models, sampling every 30 minutes, mounted about 1.7 m above the bottom (1.1 m off bottom at station 2). The manufacturer specifies a speed accuracy of $\pm 3\%$ full scale. Instrument icing was observed by divers during the March and April servicings of the current meters at stations 3, 5 and 7. The meters became more buoyant and current measurements may have been affected. 99% of all speed measurements were less than 5 cm/s. Profiles of current were also obtained using an Endeco 110 with deck readout.

Temperature/salinity profiles were obtained using a Martek Mark VII "Water Quality Analyzer". Manufacturer-specified accuracies were $\pm 0.1^\circ\text{C}$ and ± 0.07 mmho/cm.

No detailed station information was available for plots and listings.

79-0042 SOHIO, Nortec

Times are local AST.

79-0043 Woodward-Clyde/Chin (1980), Mangarella and Chin (1980)

A dye dispersion study was conducted on Aug. 30-31, 1979. A bivariate drogue was used to provide reference. Profiles were made with a fluorometer, and a Martek Mark VII provided temperature and salinity data. An Endeco 105 current meter was also moored 1.2 m off bottom (30 minute sampling time).

In July and August, CTD and current profiles were obtained at 15 sampling stations. One current meter was moored July 25 - Aug. 15 and 4 during the period Aug. 15-31.

The primary references could not be obtained for detailed station information.

79-0045

Woodhead surface drifters were released during May 18-22 north of Beechey Point, and on May 24 north of Tigvariak Island.

79-0046 University of Alaska

Of the six moorings to be recovered in November, apparently only three were recovered. The Stefansson Sound mooring was serviced August 16 (and recovered in November ?); the Egg Channel mooring was recovered in November as was the one at Milne Point. The remaining three (Narwhal Island, Beechy 40 and 100) were not recovered in November 1979. Plans were to try again in 1980. The report of these results is presently unavailable.

79-0047 Kinnetic Labs, OCSEAP/Wilson et al. (1981a)

Three deployments of drifting buoys were made with 2 shore-based radio direction-finding stations used to track the buoys. Also, a small-scale drifter experiment was conducted in Prudhoe Bay to provide values of eddy diffusion coefficients for a model. The drogues for the diffusion experiment had 6-square-m (65-square-foot) sails.

79-0048 LGL, OCSEAP/Craig and Griffiths (1981a)

Two winter cruises (Nov. 1-17, 1979 and Apr. 29 - May 6, 1980) were conducted to sample fish and invertebrates. Temperature/salinity were also measured using unspecified equipment.

79-0049 U.S. Coast Guard

D. Murphy and I. Lissauer of the U.S. Coast Guard Research and Development Center deployed Woodhead drifters (plastic concave discs) at scattered sites north of Prudhoe Bay on July 12, 1979. The results are included in Matthews (1981a). Roughly 6% of the discs were recovered.

79-0050 LOREX Ice Station

The LOREX (Lomonosov Ridge Experiment, Weber, 1979) experiment included hydrographic casts and measurements from moored current meters.

At 2 sites, Aanderaa current meters were moored 25 and 200 m above the bottom. One of the deep current meters malfunctioned electronically and produced no useful data. The meters also recorded temperature.

Temperature/salinity observations were made by Robert Moore and Malcolm Lowings (Moore et al., 1983). Reversing thermometers were mounted on Niskin and Go-Flo bottles; salinity was determined using a portable Bissett-Berman inductively coupled salinometer. There were generally more than the 1 cast/day indicated here. The station locations were taken from Ostlund (1982). One location at latitude 86°N is suspect; it probably should be 89°N.

79-0057 Oceanographic Services Inc. (1980b)

A bottom mounted pressure sensor was used to measure wave and tide conditions in 13.7 m (45 feet) of water north of Reindeer Island. Currents were also measured using a SeaTrak Savonius-rotor and Endeco 105 current meters. The data are confidential but may be purchased for \$45,000, presumably U.S. funds. The mooring was moved about 3 km by ice, damaging the near-surface current meter.

79-0058 'BEAUMOP', EXXON

Current measurements were made at one site in about 15 m of water, north of Reindeer Island (offshore Prudhoe Bay). This was part of the Beaumop program funded by a group of oil companies, including EXXON. The data are mentioned in a transcript of a technical seminar on gravel island design given by EXXON. The data are proprietary. Further inquiries should be directed to EXXON, Houston (Jim Bennett, 713-656-1904).

79-0061 University of Alaska

The method of temperature determination was not stated (Naidu, 1979).

79-? Sever-31

No details are available.

80-0001 U.S. Coast Guard, CANMAR/Murphy et al. (1983)

Eight buoys (four 30 m-drogued Polar Research Lab and 4 undrogued CANMAR design) were tracked using the ARGOS system. All were released in the MacKenzie Bay area, and 3 moved west across the 141°W meridian. It is unknown for how long the Polar Research Lab buoys retained their drogues, particularly since they were often in water too shallow for the 30-m drogue. Although the buoys were initially deployed in open water, they later became engulfed by newly-forming ice.

80-0037 LGL/OCSEAP/Craig and Griffiths (1981a, b)

Three cruises for fish and invertebrate studies in Harrison Bay were made by LGL personnel (Aug. 3-5, Aug. 7-9, Aug. 13-14). Surface and bottom temperatures and salinities were recorded at 32 stations using a YSI-33 salinity/conductivity meter. The specified accuracy was +0.6°C and +1.1‰. Station locations have been extracted from Figure 2 of Craig and Griffiths (1981a); exact dates of station occupation are not given.

80-0038 University of Alaska

These data are tabulated in Matthews (1981c). Current meters and tide gauges were deployed at nine sites in early August. The table indicates that all except one site were to be recovered in September. The Atigaru Point I mooring was apparently recovered July 1981. No report of results has yet been obtained. All stations are plotted and listed; however they may not all have been recovered.

80-0039 University of Alaska/Naidu et al. (1981)

Water samples were collected using a float plane (some samples were collected from west Harrison Bay using the R.V. D.W. Hood). Temperature was measured immediately after collection; 100-ml samples were then set aside for salinity determination at the Fairbanks Laboratory using a Beckman RC-19 conductivity bridge. The locations where samples were collected were not provided in Naidu et al. (1981). They have been extracted from Figure 1 and are accurate to about +1 minute.

80-0040 Kinnetic Lab.

A diffusivity experiment (similar to the one done in 1979, see data set 79-0047) was done in Harrison Bay using window-shade type curtain drogues. Tracking was done using a microwave range-range system.

80-0041 LGL, OCSEAP/Craig and Griffiths (1981a)

As part of a biological survey, surface and bottom temperature/salinity data were collected using a YSI-33 meter (specifications $\pm 0.6^{\circ}\text{C}$ and $\pm 1.1^{\circ}/\text{oo}$).

80-0044 OSI for SOHIO/OSI (1980a)

A Sea Data burst-recording pressure gauge was moored 0.3 m off the bottom in 7.3 m of water, located about 9 km north of the Sagavanirktok River delta. The gauge measured waves, tides, surges and temperature for 32 days. The water pressure and temperature were measured every 7.5 minutes and waves every 3 hours, apparently using higher-frequency "burst" sampling.

80-0045 Soviet Aircraft Landings, Sever-32

During February - May 1980, 156 stations were surveyed (Polar Record, 1981). Chemical pollution was one of the subjects studied. No further details have been located.

80-0046 National Ocean Survey

The data were collected by the National Ocean Survey (formerly Coast and Geodetic Survey) and are now on file with the National Ocean Service, Maryland. No supporting documentation describing methods and accuracy has been found.

80-0047 University of Alaska

Salinity was determined along with nutrient concentrations. The data are to appear in a final OCSEAP report (in preparation). Further inquiries should be directed toward Dr. D. Schell of the University of Alaska (907-474-7115).

80-0048 APL Ice Camp/Garrison et al. (1982)

Data was collected from a drifting ice camp. A CTD developed by APL was used to obtain profiles about 3 times daily. Water samples for calibration were analyzed using precision laboratory conductivity cells. The temperature accuracy was checked against another thermistor. The temperature and conductivity measurements were not simultaneous in the identical water mass, but were matched in the analysis using a computer program.

Current profiles were also made using a Marsh-McBirney meter during Sept. 18-20.

Times in the report are given as local time, not GMT. Station locations were extracted from Figure 16.

80-0049 Polar Sea, SAI

These data were collected by Scientific Applications Inc. (SAI) personnel aboard the Polar Sea after the APL-University of Washington ice camp was established (see 80-0048). For convenience, the information was included in Garrison et al. (1982). John Newton of SAI was also to prepare a report. No instrument type or accuracy were specified.

80-0050 Oceanographic Services Inc. (1981b)

Waves, tides and currents were measured at 5 locations on the Alaskan shelf. Wind, barometric pressure and temperature were measured at Narwhal Island. Surge gauges were to be installed at 4 locations. Measurements extended from late August to October at 4 sites and into November at one site.

The data are considered confidential by EXXON until 1990 and they will not release any information. Jim Bennett of EXXON (713-656-1904) was the person contacted.

80-0054 University of Alaska, OCSEAP

See 78-0059.

81-0033 Woodward-Clyde for Prudhoe Bay Unit Owners/Mangarella et al. (1982)

The physical oceanography program was part of a multi-disciplinary study of the environmental effects of a waterflood extension project for the Prudhoe Bay oil field. Measurements included water level, CTD, drogues and current meters. The study area was primarily to the west of the causeway. Positioning was done using a Motorola Mini-Ranger. The shore transponders were either located on benchmarks, or their positions determined by surveying from a known benchmark.

CTD and CM station information was not received and therefore are not plotted or listed in this report. For further details contact J.M. Colonell (907-561-1020).

A. CTD

Conductivity and temperature were measured every 0.5 m using a Martek VIII Data Logger. Estimated accuracies were $\pm 0.1^{\circ}\text{C}$ and ± 0.1 mmho/cm. The instrument was factory calibrated prior to use. Salinity was determined following Perkin and Walker (1972), with an estimated accuracy of $\pm 0.2^{\circ}/\text{oo}$.

B. Eulerian Currents

Aanderaa RCM-4's were used to measure speed, direction, temperature and conductivity. The instruments were calibrated by Aanderaa prior to deployment. Estimated accuracies are $\pm 0.15^{\circ}\text{C}$, ± 0.02 mmho/cm and ± 1 cm/s or $\pm 2\%$ of the actual speed. One record provided conductivity only.

The meters were moored in water about 2 m deep. Mooring motion was minimized by using a rigid mooring. However, wave effects may still have contaminated the records and directions may be incorrect due to the proximity of the metal frames to the current meter compasses.

C. Water Level

A Sea Data model 635-11 was used to record water level. Water pressure fluctuation due to waves were sampled in a burst mode and those due to the tide were integrated over a 7.5 minute interval. Instrument sensitivity is about 1 millimetre equivalent water level.

D. Lagrangian Currents

Drifters, drogued between 0.5 and 2.0 m depth, were used to record near-surface drift.

81-0035 R.V. D.W. Hood, Kinnetic Labs/Wilson et al. (1981b, 1982)

An InterOcean model 513D CTD was used to collect temperature/salinity data. Surface water samples were collected for salinity calibration and reversing thermometers for temperature.

The types of moored current meters used were Aanderaa, Marsh-McBirney electromagnetic and General Oceanics.

A tide gauge, moored in Peard Bay, provided no useful data. Times were recorded in local (CAT) time.

81-0036 LGL for Department of Army Corps of Engineers/Griffiths and Gallaway (1982)

The main project involved fish monitoring, however temperature and salinity data were collected daily (July 3 - Sept. 13) using a YSI-33 meter. The specified accuracy is:

temperature - ± 0.1 at -2°C , ± 0.6 at 45°C
 salinity - $\pm 0.9^{\circ}/\text{oo}$ above 4°C , $\pm 1.0^{\circ}/\text{oo}$ below 4°C .

Positions have been extracted from figures in the report and are considered accurate to about ± 1 minute.

81-0037 U.S. Coast Guard, Frozen Sea Research Group

The CTD program was the responsibility of the Frozen Sea Research Group at IOS (Melling, pers. comm.) whereas the current meter data were collected by the U.S. Coast Guard (Robe, 1982).

81-0038 U.S. Coast Guard/CANMAR/Murphy et al. (1983)

Eight undrogued drifters were released in the MacKenzie Bay area in the summer of 1981. Tracking was done using the ARGOS system. Only one buoy (2604) crossed the 141°W meridian. By this time, the buoy was in 9 to 10 tenths young ice.

81-0040 Soviet Aircraft Landings, Sever-33

As part of the Poley - Global Atmospheric Research Program, 150 stations were occupied (Polar Record, 1982). Methods, area, etc. are unknown.

81-0041 Submarine

Water samples were collected using a U.S. submarine (Ostlund, pers. comm.); however the location, dates, etc. have not yet been made available. Further inquiries should be directed to Dr. Ostlund at the Rosenstiel School of Marine Science, University of Miami (305-361-4100).

81-0042 Oceanographic Services Inc.

Waves, water level, currents and water temperature were measured at two locations in Harrison Bay (9-m and 18-m water depths) and at one location off Pingok Island (9 m). OSI collected the data and the program was funded by six oil companies. EXXON is respecting the 1992 confidentiality date and will not allow OSI to release any information. The person contacted at EXXON was Jim Bennett (713-656-1904).

81-0044 National Ocean Survey

The water level data are on file with the National Ocean Service. No details were provided.

81-0045 University of Alaska

See 80-0047.

81-0046 Harding Lawson for EXXON/Toimil and England (1982)

This study concerned the effects of a gravel island built to support a drill rig. Sea-Track current meters were used to measure currents, and divers collected water samples which were later analyzed for salinity. The method of salinity determination and the current meter specifications were not provided in Toimil and England (1982). The March current record was only three days long.

Sampling sites were closely spaced (about 200-300 m) around the island location; however only one location has been used, taken from a figure in the report.

81-0047 Northern Technical Services for ARCO/NORTEC (1982)

This was the first year of a 5-year program (NPDES) to monitor the marine environmental effects of the Waterflood project. Beginning August 1981, sampling programs were to be conducted every spring (April) and summer (August). Temperature/salinity data are collected along with the biological sampling. It is not clear from the report what instrument was used in 1981, but in August 1982, it was a YSI SCT meter. The reports do not specify time or day of measurements.

81-0048 University of Washington

The type and accuracy of instrumentation is unknown. Contact Dick Tripp (206-543-5334).

81-0049 Oceanographic Services Inc. for SOHIO/OSI (1981a)

A Sea Data pressure gauge was moored on the bottom, in 4.6 m of water, off the Sagavanirktok River delta. The gauge was set to burst-sample wave measurements every 3 hours and recorded water level (for tides) every 7.5 minutes, both to 1.5-mm accuracy. Water level was computed from measured pressure using the relationship: 1 m seawater = 100.71 mb. From a flow chart

in the report, it is implied that atmospheric pressure fluctuations were accounted for. The instrument also had a thermistor for temperature readings to 0.07°C accuracy.

81-0051 Woodward-Clyde Consultants/Colonell and Weingartner (1982a)

This was a survey of the lagoon, inshore of the barrier islands. Good data were obtained from four moored instruments and two sets of CTD casts at 29 stations on a 1 X 2 km grid spacing. Only the central location was provided, plotted and listed. Further inquiries should be directed to Jack Colonell of Woodward-Clyde Consultants, Anchorage (907-561-1020).

81-0052 Woodward-Clyde Consultants/Colonell and Weingartner (1982b)

Data were obtained from six moored instruments and one set of CTD casts at 49 stations on a 0.5 X 2.0 km grid spacing. All data were good except for portions of two current meter records, in which directions were biased by a magnet problem. Only the central location of the survey was provided, plotted and listed. Further inquiries should be directed to Jack Colonell of Woodward-Clyde Consultants, Anchorage.

81-7 NP-25

The ice island was initially occupied 500 km NW of Wrangel Island (Polar Record, 1982). No further details are known.

82-0012 Northern Technical Service/SOHIO

Environmental studies related to the Endicott Development Project (just east of Prudhoe Bay) began in 1981. The 1982 results are presented in Britch et al. (1983).

301 CTD profiles were obtained using an InterOcean CSTD probe. The accuracies were given as $\pm 0.05^\circ\text{C}$, $\pm 0.05^\circ/\text{oo}$ and ± 1.0 m. No discussion of calibration techniques is provided.

Neil Brown ACM-2 acoustic current meters were deployed at 5 locations. They measured speed, direction, temperature and salinity. Manufacturer's specifications for accuracy were given as ± 1 cm/s or 5%, ± 2 degrees, $\pm 0.5^\circ\text{C}$ and $\pm 0.03\%$ full scale conductivity.

A Sea Data 635-11 tide gauge was also attached to mooring 2.

82-0013 LGL-NORTEC/SOHIO/Griffiths et al. (1983)

The study emphasis was on fish ecology. Water temperatures were measured using mercury in-glass thermometers ($\pm 0.5^\circ\text{C}$); salinity with a YSI-33 meter ($\pm 1.0^\circ/\text{oo}$), and turbidity with a Hach model 2100A Turbidimeter. Actual station locations, times, etc. were not specified. Station locations have been estimated based on Figure 3.3-1 and are accurate to about ± 0.5 minute. In addition to the stations included here, temperature was measured daily at 6 gill-net stations and at the end of East Dock.

82-0014 SAI, OCSEAP/Hachmeister and Vinelli (1983)

This environmental survey covered the nearshore area east of Prudhoe Bay to the Yukon border. Two field studies were conducted to cover early summer (July - August 1982 ID 82-0014) and fall (September 1982 ID 82-0015) conditions. In general, estimates of data accuracy were unavailable.

Phase I: July 21 - Aug. 8, 1982

Three current meters (2 Aanderaa, 1 Neil Brown) were deployed in Angun Lagoon and Pokok Bay. An Aanderaa pressure gauge was also moored at the Angun Lagoon entrance. After 11 days, it was moved inside the lagoon. The Neil Brown was placed at the entrance to Angun Lagoon; the Aanderaas were placed inside the embayments, primarily for their temperature/salinity recordings. Their velocity records may be wave-contaminated. Also, the directional data for the Pokok Bay site may be useless.

Eight sets of surface and 5 sets of bottom drifters were deployed between July 26-29, 1982. The seabed drifters were umbrella-shaped and the surface drifters were yellow polypropylene, 6.4 cm x 8.9 cm (2.5" x 3.5").

82-0015 SAI, OCSEAP/Hachmeister and Vinelli (1983)

Phase II: Sept. 7-15, 1982 (see 82-0014 for Phase I)

Fourteen CTD profiles were obtained from a Zodiac in Angun Lagoon. The instrument and data quality is not specified. Only two nominal station locations, one for each transect, have been used here.

82-0016 University of Alaska/Schell et al. (1983)

Two field trips were made, primarily for biological studies (July 24 - Aug. 7 and Sept. 18-23). Water samples were analyzed for nutrients, etc. and temperature/salinity. No methods or accuracies are given. Station locations were extracted from figures in the report.

82-0017 LGL/Griffiths (1983)

As part of a fish study, temperature and salinity data were measured daily using in-glass mercury thermometers ($\pm 0.5^{\circ}\text{C}$) and a YSI-33 meter ($\pm 1.0^{\circ}/\text{oo}$). Station locations have been estimated (to about ± 1 minute) from Figure 3-1 of Griffiths (1983).

82-0026 University of Alaska

These data are not yet published. They should appear in a future OCSEAP report of principal investigators. Further inquiries should be directed to Dr. D. Schell, University of Alaska (907-474-7115).

82-0027 Oceanographic Services Inc.

Waves, water level, current and temperature were measured as in 1981 (see 81-0042). See comments under 81-0042; the confidentiality date for the 1982 data is 1993.

82-0030 NORTEC for ARCO/NORTEC (1982)

See 81-0047.

82-0031 NORTEC for ARCO/NORTEC (1983b)

This is the summer (August) sampling of the second year of the NPDES monitoring program (see 81-0047). A YSI SCT meter was used to measure conductivity and temperature.

82-0032 Kinnetic Laboratories Inc., EXXON

Apparently Kinnetic Laboratories did some work for EXXON in 1982. No report or reference to the data has been found. EXXON is very reluctant to release such information. Further inquiries should be directed to EXXON Production Research Co., Houston (Mr. B. Gordon, phone 713-940-4672).

82-0033 NORTEC for Shell/Northern Technological Service (1983a)

This study was designed to monitor physical and chemical effects associated with open-water disposal of drilling muds and cuttings at Tern Island. An Endeco 105 current meter was moored at 3.3 m depth in water 6.7 m deep. Full data recovery was obtained for the July 31 - Sept. 17 deployment period. As well, CTD profiles were made using an InterOcean CSTD during Aug. 26-27.

82-0043 Kinnetic Laboratories Inc., U.S. Army/Savoie and Wilson (1983)

This was a study of the effects of lengthening the West Dock at Prudhoe Bay. Aanderaa RCM-4 current meters, with conductivity and temperature probes, were deployed on each side of the causeway. An Endeco 105 was moored in the causeway breach.

A grid of 42 CTD stations was established. Sampling was done using a Beckman RS5-3 with a stated accuracy of $\pm 0.05^\circ/\text{oo}$ and $\pm 0.05^\circ\text{C}$. In addition to the grid of 42 stations, nineteen stations were sampled immediately to the west of the breach, to study a possible low-salinity plume there. The entire 42-station grid was sampled on each of the following days: July 24, 25, 26, 28 and 29; August 16, 17, 18, 19, 20; and September 13, 15.

82-0047 Woodward-Clyde Consultants/Colonell and Weingartner (1983)

Good data were obtained from six moored instruments and three sets of CTD casts at approximately 20 stations on a 2-km grid spacing. Only the central location of the survey was provided, plotted and listed. Further inquiries should be directed to Jack Colonell of Woodward-Clyde Consultants, Anchorage (907-561-1020).

82-0048 Woodward-Clyde Consultants/Critchlow (1983)

Although primarily a fish survey, surface temperature/salinity, current and water-level data were collected at several locations around Prudhoe Bay. Temperature/salinity data were obtained using either a Beckman CTD or a YSI SCT meter. Surface currents were measured using a drogue. No accuracies were given.

82-0050 USCG, Canmar

As in 1980 (80-0001) and 1981 (81-0038), satellite-tracked drifters were released off the Tuktoyatuk Peninsula. One of the drifters, F4506, moved west along the Alaskan slope region towards Point Barrow. It is not known if there were other drifters in this area. No data report has been received yet. Further enquiries should be directed towards Mr. J. Steen of Dome/Canmar (403-231-8009).

82-? Sever-34

No information available.

83-0004 Ice Station Cesar

This study was an expedition to study the Alpha Ridge. Scientists from the University of Washington moored current meters through the ice onto the ocean floor (R. Tripp, personal communication). The moorings were later located, released from bottom and recovered by divers under the ice. The rotor of the meter at the first mooring broke, reducing the record length.

CTD data were collected by the Frozen Sea Research Group at IOS (R. Perkin, personal communication) using a Guildline 8706 CTD. A twin Otter aircraft was used and positioning was achieved by means of the Global Navigation System.

83-0005 Arctic Sciences Ltd. Aircraft Survey/IOS

A Twin Otter aircraft was used for the survey. The CTD was a Guildline 8706 probe/87102 control unit. Descent rate was controlled so the response of the conductivity and temperature sensors would be best matched. Calibrations were made for pressure, temperature and salinity. Also, simultaneous casts were made with a Bayfield Laboratory CTD in order to compare results. Refer to Fissel et al. (1984) for more detail on methods and analyses.

83-0006 Discoverer/Hachmeister (1983)

This program was part of OCSEAP and involves 3 phases: Discoverer August 1983 (83-0006); Surveyor September 1983 (83-0011), and a planned helicopter survey in February 1984. Concurrent data was collected by EG & G at Peard Bay (83-0007).

CTD stations were occupied as well as surface temperature and salinity measurements. Accuracies are as yet unknown. Four current-meter moorings were deployed. Two were recovered during the second cruise. Both surface and bottom drifters were deployed nearshore.

83-0007 EG & G

This was a nearshore survey, complimentary to 83-0006. Two phone calls and a written request for information have failed to prompt any response from Mr. Bill Galhem of EG & G. Further enquiries should be directed toward Mr. Galhem, EG & G (617-890-3710).

83-0011 Surveyor/Vinelli (1983)

See also 83-0006.

Due to bad ice conditions, only 7 CTD casts were made (surface T/S data were collected between stations), no drifters were released and neither of current meter moorings 2 or 3 could be recovered (deployed as part of 83-0006). The CTD used was not specified in the cruise report.

83-0012 Harding Lawson for EXXON/Toimil and England (1983)

Water samples collected by divers were analyzed for salinity using a Grundy 6230N salinometer. Temperatures were near freezing.

83-0013 NORTEC for ARCO/NORTEC (1983b)

See 81-0047. In April 1983, salinities were determined using a Hydrolab digital 4041 meter.

83-0018 OSI

Apparently OSI collected data for some oil companies. The AOGA project number may be 213. No further details are known. The data are likely considered confidential by the oil companies.

83-0019 NORTEC

A current meter mooring was deployed in Harrison Bay. No information is yet available. Contact Mr. Britch, NORTEC, Anchorage (907-276-4302).

83-0020 Woodward-Clyde Consultants/Colonell and Berry (1983)

Good data were obtained from five moored instruments and 6 sets of CTD casts at 12 to 46 stations on a 1-km grid spacing. Only the central location of the survey was provided, plotted and listed. Further inquiries should be directed to Jack Colonell of Woodward-Clyde Consultants, Anchorage (907-561-1020).

83-0022 NORTEC (1984)

This was part of the continuing benthos monitoring program in the area of the Prudhoe Bay causeway. From August 26 to September 4, stations A-1 through A-12 and B-2 through B-7 were sampled. Between September 16 and 18, stations B-1, B-8 and C-1 through C-16 were sampled. The method/accuracies were not evident from Nortec (1984).

83-0032 USCG, Canmar

Drifters were again released in the Canadian Beaufort Sea (see 80-0001, 81-0038, and 82-0050). As well, 5 drifters were released near Harrison Bay (approx. 151°W). All 5 moved east; 3 of the 5 crossed 141°W into the Canadian Beaufort Sea. Since no data report has been received, it is unknown if further releases were made. Contact Mr. J. Steen of Dome/Canmar (403-231-8009).

83-1 Sever-35

No details available.
